Electrical Engineering and Computer Science
University of California, Irvine

Lecture 6: Overview

- Warm-up Quiz
- Review
 - Shift operators
 - Basic Types in C
- Type conversion
 - explicit
 - implicit
- Types in Expressions
- Arithmetic computation
 - Example `Arithmetic.c`

Quiz: Question 7

- Which of the following constructs is a valid arithmetic operator in C?
(Check all that apply!)
 - a) *
 - b) .
 - c) #
 - d) >>
 - e) -

Quiz: Question 7

- Which of the following constructs is a valid arithmetic operator in C?
(Check all that apply!)
 - a) *
 - b) .
 - c) #
 -  d) >>
 -  e) -

Quiz: Question 8

- What is the value of an integer **x** after the following statement?

```
x = 8 / 2 + 10 % 3;
```

- a) 0
- b) 42
- c) -2
- d) 5
- e) 2

Quiz: Question 8

- What is the value of an integer **x** after the following statement?

```
x = 8 / 2 + 10 % 3;
```

- a) 0
- b) 42
- c) -2
-  d) 5
- e) 2

Quiz: Question 9

- What is the value of an integer **x** after the following statement?

```
x = (10 - (3 - (20 - -10)));
```

- a) -7
- b) 17
- c) 27
- d) 37
- e) 77

Quiz: Question 9

- What is the value of an integer **x** after the following statement?

```
x = (10 - (3 - (20 - -10)));
```

- a) -7
- b) 17
- c) 27
-  d) 37
- e) 77

Quiz: Question 10

- Which of the following format strings will print a **long int** value in decimal format when used with **printf()**?
 - a) "%d"
 - b) '\%ld'
 - c) "%ld"
 - d) '\%li'
 - e) "%lu"

Quiz: Question 10

- Which of the following format strings will print a **long int** value in decimal format when used with **printf()**?
 - a) "%d"
 - b) '\%ld'
 -  c) "%ld"
 - d) '\%li'
 - e) "%lu"

Shift Operators

- Left-shift operator: $x \ll n$
 - shifts x in binary representation n times to the left
 - multiplies x n times by 2
 - Examples
 - $2x = x \ll 1$
 - $4x = x \ll 2$
 - $x * 2^n = x \ll n$
 - $2^n = 1 \ll n$
- Right-shift operator: $x \gg n$
 - shifts x in binary representation n times to the right
 - divides x n times by 2
 - Examples
 - $x / 2 = x \gg 1$
 - $x / 4 = x \gg 2$
 - $x / 2^n = x \gg n$

EECS10: Computational Methods in ECE, Lecture 6

11

Basic Types in C

- Integer types
 - **char** Character, e.g. 'a', 'b', '1', '*'
• typical range [-128, 127]
 - **short int** Short integer, e.g. -7, 0, 42
• typical range [-32768, 32767]
 - **int** Integer, e.g. -7, 0, 42
• typical range [-2147483648, 2147483647]
 - **long int** Long integer, e.g. -99L, 9L, 123L
• typical range [-2147483648, 2147483647]
 - **long long int** Very long integer, e.g. 12345LL
• typical range [-9223372036854775808, 9223372036854775807]
- Integer types can be
 - **signed** negative and positive values (and 0)
 - **unsigned** positive values only (and 0)

EECS10: Computational Methods in ECE, Lecture 6

(c) 2005 R. Doemer

12

Basic Types in C

- Floating point types
 - **float** Floating point with single precision
 - Example `3.5f, -0.234F, 10E8F`
 - **double** Floating point with double precision
 - Example `3.5, -0.23456789012, 10E88`
 - **long double** Floating point with high precision
 - Example `12345678.123456E123L`
- Floating point values are in many cases *approximations* only!
 - Storage size of floating point values is fixed
 - Many values can only be represented as approximations
 - Example: `1.0 / 3.0 = .333...`

Type Conversion

- Explicit Type Conversion
 - types can be explicitly converted to other types, by use of the type cast operator:
`(type) expression`
 - the target type is named explicitly in parentheses before the source expression
 - Examples:
 - `Float = (float) LongInt`
 - converts the `long int` type into a `float` type
 - `Integer = (int) Double`
 - converts the `double` type into an `int` type
 - any fractional part is truncated!
 - `Char = (char) LongLongInt`
 - converts the `long long int` type into a `char` type
 - any out-of-range values are silently cut off!

Type Conversion

- Implicit Type Conversion
 - Type promotion
 - integral promotion
 - `unsigned` or `signed char` is promoted to `unsigned` or `signed int` before any operation
 - `unsigned` or `signed short` is promoted to `unsigned` or `signed int` before any operation
 - floating-point promotion
 - `float` is promoted to `double` before any operation
 - binary arithmetic operators are defined only for same types
 - the smaller type is converted to the larger type
 - Examples:
 - » `ShortInt * LongInt` results in a `long int` type
 - » `LongDouble * Float` results in a `long double` type
 - Type coercion
 - most types are automatically converted to expected types
 - Example: `Double = Float`, or `Char = LongInt`

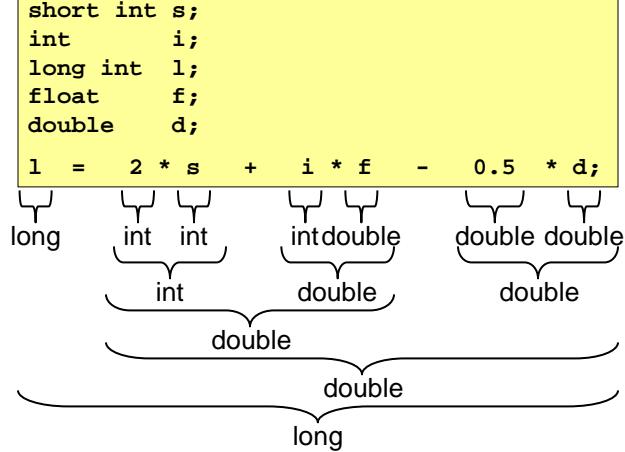

EECS10: Computational Methods in ECE, Lecture 6

(c) 2005 R. Doemer

15

Types in Expressions

- Expressions are composed of constants, variables and operators, each of which has an associated type
- Example:

EECS10: Computational Methods in ECE, Lecture 6

(c) 2005 R. Doemer

16

Example Program

- Program example:
 - Task: Write a C program that exercises arithmetic computation by use of different types and operators!
 - The program should compute the following equations:
 - Polynomial:

$$p = 2x^2 - 3x + 5$$

- Quotient of sums:

$$q = \frac{a + b}{c + d}$$

- Remainder:

$$r = \text{rem}(2^n / 7)$$

- Assume that a, b, c, d , and n are whole numbers.

Example Program

- Program example: **Arithmetic.c** (part 1/3)

```
/* Arithmetic.c: arithmetic expresions */  
/* */  
/* author: Rainer Doemer */  
/* */  
/* modifications: */  
/* 10/06/04 RD initial version */  
  
#include <stdio.h>  
  
/* main function */  
  
int main(void)  
{  
    /* variable definitions */  
    int a, b, c, d, n;  
    double p, q, r, x;  
  
    ...
```

Example Program

- Program example: **Arithmetic.c** (part 2/3)

```
...
/* input section */
printf("Please enter the value for real x:    ");
scanf("%lf", &x);
printf("Please enter the value for integer a: ");
scanf("%d", &a);
printf("Please enter the value for integer b: ");
scanf("%d", &b);
printf("Please enter the value for integer c: ");
scanf("%d", &c);
printf("Please enter the value for integer d: ");
scanf("%d", &d);
printf("Please enter the value for integer n: ");
scanf("%d", &n);

...
```

Example Program

- Program example: **Arithmetic.c** (part 3/3)

```
...
/* computation section */
p = 2.0*x*x - 3.0*x + 5.0;
q = ((double)(a + b)) / ((double)(c + d));
r = (1<<n) % 7;

/* output section */
printf("The value for the polynomial p is %f.\n", p);
printf("The value for the quotient q is %f.\n", q);
printf("The value for the remainder r is %f.\n", r);

/* exit */
return 0;
} /* end of main */

/* EOF */
```

Example Program

- Example session: **Arithmetic.c**

```
% vi Arithmetic.c
% gcc Arithmetic.c -Wall -ansi -o Arithmetic
% ls -l
total 20
-rwx----- 1 doemer    faculty      7344 Oct  6 08:42 Arithmetic*
-rw------- 1 doemer    faculty     1154 Oct  6 08:37 Arithmetic.c
% Arithmetic
Please enter the value for real x:  3.1415927
Please enter the value for integer a: 5
Please enter the value for integer b: 6
Please enter the value for integer c: 7
Please enter the value for integer d: 8
Please enter the value for integer n: 9
The value for the polynomial p is 15.314431.
The value for the quotient q is 0.733333.
The value for the remainder r is 1.000000.
%
```
