Electrical Engineering and Computer Science  
University of California, Irvine

## Review of Lectures 18 - 24

- Lecture 18: Recursion
- Lecture 19: Structures, unions, enumerators
- Lecture 20: Binary data representation
- Lecture 21: Memory organization, pointers
- Lecture 22: Pointer operations, string operations
- Lecture 23: File processing
- Lecture 24: Translation units

# Recursion

- Introduction
  - Recursion is often an alternative to Iteration
  - Recursion is a very simple concept, yet very powerful
  - Recursion is present in nature
    - Trees have branches, which have branches, which have branches, ... which have leaves.
  - Recursion is traversal of hierarchy
    - Traverse (climb) a tree to the top:
      - start at the root
      - at a leaf, stop
      - at a branch, traverse one branch
    - Traverse a file system on a computer
      - start at the current directory
      - at a file, process the file
      - at a directory, traverse the directory

# Recursion

- Recursive Function
  - Function that calls itself ...
    - ... directly, or
    - ... indirectly
- Concept of Recursion
  - Trivial base case
    - Return value defined for simple case
    - Example: `if (arg == 0) {return 1; }`
  - Recursion step
    - Reduce the problem towards the base case
    - Make a recursive function call
    - Example: `if (arg > 0) { return ...fct(arg-1); }`
- Termination of Recursion
  - Converging of recursive calls to the base case
  - Recursive call must be “simpler” than current call

```
int f(...)  
{ ...  
  f(...);  
  ...  
}
```

```
int a(...)  
{ ...  
  b(...);  
  ...  
}  
int b(...)  
{ ...  
  a(...);  
  ...  
}
```

## Recursion

- Example: Factorial function  $n!$ 
  - The factorial of a non-negative integer is
    - $n! = n * (n-1) * (n-2) * (n-3) * \dots * 1$
  - This can be written as
    - $n! = n * ((n-1) * ((n-2) * ((n-3) * (\dots * 1))))$
  - Recursive definition:
    - $n=1: 1! = 1$  (base case)
    - $n > 1: n! = n * (n-1)!$  (recursion step)
  - Example computation:

$$\begin{aligned}
 5! &= 5 * 4! \\
 &= 5 * (4 * 3!) \\
 &= 5 * (4 * (3 * 2!)) \\
 &= 5 * (4 * (3 * (2 * 1!))) \\
 &= 5 * (4 * (3 * (2 * 1))) \\
 &= 5 * (4 * (3 * 2)) \\
 &= 5 * (4 * 6) \\
 &= 5 * 24 \\
 &= 120
 \end{aligned}$$

EECS10: Computational Methods in ECE, Review 18-24 (c) 2007 R. Doemer 5

## Recursion

- Program example: **Factorial.c** (part 1/2)

```

/* Factorial.c: example demonstrating recursion */
/* author: Rainer Doemer */
/* modifications: */
/* 11/14/04 RD initial version */

#include <stdio.h>

/* function definition */

long factorial(long n)
{
    if (n == 1)           /* base case */
    {
        return 1;
    } /* fi */
    else                  /* recursion step */
    {
        return n * factorial(n-1);
    } /* esle */
} /* end of factorial */

...

```

EECS10: Computational Methods in ECE, Review 18-24 (c) 2007 R. Doemer 6

## Recursion

- Program example: **Factorial.c** (part 2/2)

```
...
int main(void)
{
    /* variable definitions */
    long int n, f;

    /* input section */
    printf("Please enter value n: ");
    scanf("%ld", &n);

    /* computation section */
    f = factorial(n);

    /* output section */
    printf("The factorial of %ld is %ld.\n", n, f);

    /* exit */
    return 0;
} /* end of main */

/* EOF */
```

## Recursion

- Example session: **Factorial.c**

```
% vi Factorial.c
% gcc Factorial.c -o Factorial -Wall -ansi
% Factorial
Please enter value n: 1
The factorial of 1 is 1.
% Factorial
Please enter value n: 2
The factorial of 2 is 2.
% Factorial
Please enter value n: 3
The factorial of 3 is 6.
% Factorial
Please enter value n: 5
The factorial of 5 is 120.
% Factorial
Please enter value n: 10
The factorial of 10 is 3628800.
%
```

## Recursion vs. Iteration

- Example: Factorial function  $n!$ 
  - The factorial of a non-negative integer is
    - $n! = n * (n-1) * (n-2) * (n-3) * \dots * 1$
  - This can be written as
    - $n! = n * ((n-1) * ((n-2) * ((n-3) * (\dots * 1))))$
  - Recursive definition:
    - $n=1: 1! = 1$  (base case)
    - $n > 1: n! = n * (n-1)!$  (recursion step)
  - Iterative implementation:
    - Compute  $n$  products in a loop
    - $n! = n * (n-1) * (n-2) * (n-3) * \dots * 1$
    - ```
p = n;
for (f=n-1; f>=1; f--)
{ p = p * f; }
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

9

## Recursion vs. Iteration

- Program example: **Factorial2.c** (part 1/2)

```
/* Factorial2.c: example demonstrating iteration */
/* author: Rainer Doemer */
/* modifications: */
/* 11/14/04 RD initial version (based on Factorial.c) */

#include <stdio.h>

/* function definition */

long factorial(long n)
{
    long product, factor;

    product = n;
    for(factor = n-1; factor >=1; factor--)
        { product *= factor;
        } /* rof */
    return product;
} /* end of factorial */

...
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

10

## Recursion vs. Iteration

- Program example: **Factorial2.c** (part 2/2)

```
...
int main(void)
{
    /* variable definitions */
    long int n, f;

    /* input section */
    printf("Please enter value n: ");
    scanf("%ld", &n);

    /* computation section */
    f = factorial(n);

    /* output section */
    printf("The factorial of %ld is %ld.\n", n, f);

    /* exit */
    return 0;
} /* end of main */

/* EOF */
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

11

## Recursion vs. Iteration

- Example session: **Factorial2.c**

```
% cp Factorial.c Factorial2.c
% vi Factorial2.c
% gcc Factorial2.c -o Factorial2 -Wall -ansi
% Factorial2
Please enter value n: 1
The factorial of 1 is 1.
% Factorial2
Please enter value n: 2
The factorial of 2 is 2.
% Factorial2
Please enter value n: 3
The factorial of 3 is 6.
% Factorial2
Please enter value n: 5
The factorial of 5 is 120.
% Factorial2
Please enter value n: 10
The factorial of 10 is 3628800.
%
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

12

## Recursion

- Example 2: Fibonacci series
  - Sequence of integers
    - 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987, ...
  - Mathematical properties
    - The first two numbers are 0 and 1
    - Every subsequent Fibonacci number is the sum of the previous two Fibonacci numbers
  - Ratio of successive Fibonacci numbers is ...
    - ... converging to constant value 1.618...
    - ... called *Golden Ratio* or *Golden Mean*
  - Recursive definition:
    - Base case:  $\text{fibonacci}(0) = 0$   
 $\text{fibonacci}(1) = 1$
    - Recursion step:  $\text{fibonacci}(n) = \text{fibonacci}(n-1) + \text{fibonacci}(n-2)$

## Recursion

- Program example: **Fibonacci.c** (part 1/2)

```
/* Fibonacci.c: example demonstrating recursion */
/* author: Rainer Doemer */
/* modifications: */
/* 11/14/04 RD initial version */

#include <stdio.h>

/* function definition */
long fibonacci(long n)
{
    if (n <= 1) /* base case */
    {
        return n;
    } /* fi */
    else /* recursion step */
    {
        return fibonacci(n-1) + fibonacci(n-2);
    } /* esle */
} /* end of fibonacci */

/* main function */
...
```

## Recursion

- Program example: **Fibonacci.c** (part 2/2)

```
...
int main(void)
{
    /* variable definitions */
    long int n, f;

    /* input section */
    printf("Please enter value n: ");
    scanf("%ld", &n);

    /* computation section */
    f = fibonacci(n);

    /* output section */
    printf("The %ld-th Fibonacci number is %ld.\n", n, f);

    /* exit */
    return 0;
} /* end of main */

/* EOF */
```

## Recursion

- Example session: **Fibonacci.c**

```
% cp Factorial.c Fibonacci.c
% vi Fibonacci.c
% gcc Fibonacci.c -o Fibonacci -Wall -ansi
% Fibonacci
Please enter value n: 1
The 1-th Fibonacci number is 1.
% Fibonacci
Please enter value n: 10
The 10-th Fibonacci number is 55.
% Fibonacci
Please enter value n: 20
The 20-th Fibonacci number is 6765.
% Fibonacci
Please enter value n: 30
The 30-th Fibonacci number is 832040.
% Fibonacci
Please enter value n: 40
The 40-th Fibonacci number is 102334155.
%
```

## Data Structures

- Structures (aka. records): **struct**
  - User-defined, composite data type
    - Type is a composition of (different) sub-types
  - Fixed set of members
    - Names and types of members are fixed at structure definition
  - Member access by name
    - Member-access operator: ***structure\_name.member\_name***
- Example:

```
struct S { int i; float f; } s1, s2;

s1.i = 42;      /* access to members */
s1.f = 3.1415;
s2 = s1;        /* assignment */
s1.i = s1.i + 2*s2.i;
```

## Data Structures

- Structure Declaration
  - Declaration of a user-defined data type
- Structure Definition
  - Definition of structure members and their type
- Structure Instantiation and Initialization
  - Definition of a variable of structure type
  - Initializer list defines initial values of members
- Example:

```
struct Student;           /* declaration */

struct Student           /* definition */
{ int ID;                /* members */
  char Name[40];
  char Grade;
};

struct Student Jane =    /* instantiation */
{1001, "Jane Doe", 'A'}; /* initialization */
```

## Data Structures

- Structure Access
  - Members are accessed by their name
  - Member-access operator .
- Example:

```
struct Student
{
    int ID;
    char Name[40];
    char Grade;
};

struct Student Jane =
{1001, "Jane Doe", 'A'};

void PrintStudent(struct Student s)
{
    printf("ID: %d\n", s.ID);
    printf("Name: %s\n", s.Name);
    printf("Grade: %c\n", s.Grade);
}
```

|       |            |
|-------|------------|
|       | Jane       |
| ID    | 1001       |
| Name  | "Jane Doe" |
| Grade | 'A'        |

|                |
|----------------|
| ID: 1001       |
| Name: Jane Doe |
| Grade: A       |

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

19

## Data Structures

- Unions: **union**
  - User-defined, composite data type
    - Type is a composition of (different) sub-types
  - Fixed set of *mutually exclusive* members
    - Names and types of members are fixed at union definition
  - Member access by name
    - Member-access operator: `union_name.member_name`
  - *Only one member may be used at a time!*
    - All members share the same location in memory!
- Example:

```
union U { int i; float f; } u1, u2;
u1.i = 42; /* access to members */
u2.f = 3.1415;
u1.f = u2.f; /* destroys u1.i! */
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

20

## Data Structures

- Union Declaration
  - Declaration of a user-defined data type
- Union Definition
  - Definition of union members and their type
- Union Instantiation and Initialization
  - Definition of a variable of union type
  - *Single* initializer defines value of *first* member
- Example:

```
union HeightOfTriangle; /* declaration */
union HeightOfTriangle /* definition */
{ int Height; /* members */
  int LengthOfSideA;
  float AngleBeta;
};

union HeightOfTriangle H /* instantiation */
= { 42 }; /* initialization */
```

EECS10: Computational Methods in ECE, Review 18-24

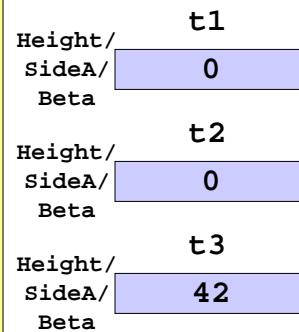

(c) 2007 R. Doemer

21

## Data Structures

- Union Access
  - Members are accessed by their name
  - Member-access operator .
- Example:

```
union HeightOfTriangle
{ int Height;
  int SideA;
  float Beta;
};
union HeightOfTriangle t1, t2, t3
= { 42 };
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

22

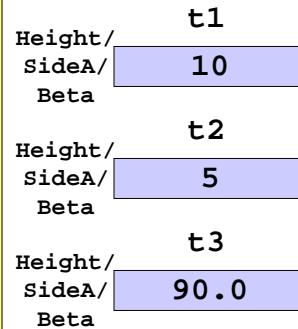

## Data Structures

- Union Access
  - Members are accessed by their name
  - Member-access operator .
- Example:

```
union HeightOfTriangle
{
    int Height;
    int SideA;
    float Beta;
};

union HeightOfTriangle t1, t2, t3
= { 42 };

void SetHeight(void)
{
    t1.Height = 10;
    t2.SideA = t1.Height / 2;
    t3.Beta = 90.0;
}
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

23

## Data Structures

- Enumerators: `enum`
  - User-defined data type
    - Members are an enumeration of integral constants
  - Fixed set of members
    - Names and values of members are fixed at enumerator definition
  - Members are constants
    - Member values cannot be changed after definition
- Example:

```
enum E { red, yellow, green };
enum E LightNS, LightEW;

LightEW = green;           /* assignment */
if (LightNS == green)     /* comparison */
{ LightEW = red; }
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

24

## Data Structures

- Enumerator Declaration
  - Declaration of a user-defined data type
- Enumerator Definition
  - Definition of enumerator members and their value
- Enumerator Instantiation and Initialization
  - Definition of a variable of enumerator type
  - Initializer should be one member of the enumerator
- Example:

```
enum Weekday;           /* declaration */
enum Weekday            /* definition */
{ Monday, Tuesday,      /* members */
  Wednesday, Thursday,
  Friday, Saturday, Sunday
};

enum Weekday Today     /* instantiation */
= Wednesday;           /* initialization */
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

25

## Data Structures

- Enumerator Values
  - Enumerator values are integer constants
  - By default, enumerator values start at 0 and are incremented by 1 for each following member
- Example:

Today

Wednesday

Day: 2

```
enum Weekday
{ Monday,
  Tuesday,
  Wednesday,
  Thursday,
  Friday,
  Saturday,
  Sunday
};

enum Weekday Today
= Wednesday;

void PrintWeekday(
    enum Weekday d)
{
    printf("Day: %d\n", d);
}
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

26

## Data Structures

- Enumerator Values
  - Enumerator values are integer constants
  - By default, enumerator values start at 0 and are incremented by 1 for each following member
  - Specific enumerator values may be defined by the user
- Example:

Today  
**Wednesday**  
 Day: 3

```
enum Weekday
{ Monday = 1,
  Tuesday,
  Wednesday,
  Thursday,
  Friday,
  Saturday,
  Sunday
};

enum Weekday Today
= Wednesday;

void PrintWeekday(
    enum Weekday d)
{
    printf("Day: %d\n", d);
}
```

## Data Structures

- Enumerator Values
  - Enumerator values are integer constants
  - By default, enumerator values start at 0 and are incremented by 1 for each following member
  - Specific enumerator values may be defined by the user
- Example:

Today  
**Wednesday**  
 Day: 4

```
enum Weekday
{ Monday = 2,
  Tuesday,
  Wednesday,
  Thursday,
  Friday,
  Saturday,
  Sunday = 1
};

enum Weekday Today
= Wednesday;

void PrintWeekday(
    enum Weekday d)
{
    printf("Day: %d\n", d);
}
```

## Data Structures

- Type definitions: **typedef**
  - A *typedef* can be defined as an alias type for another type
  - A *typedef* definition follows the same rules as a variable definition
  - Type definitions are usually used to abbreviate access to user-defined types
- Examples:

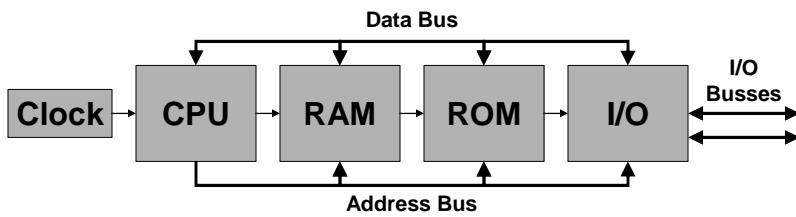

```
typedef long MyInteger;

typedef enum Weekday Day;
Day Today;

typedef struct Student Scholar;
Scholar Jane, John;
```

## Basic Computer Architecture

- Essential Computer Components
  - Central Processing Unit (CPU)
    - e.g. Intel Pentium, Motorola PowerPC, Sun SPARC, ...
  - Random Access Memory (RAM)
    - storage for program and data, read and write access
  - Read Only Memory (ROM)
    - fixed storage for basic input/output system (BIOS)
  - I/O Units
    - Input/output units connecting to peripherals

## Binary Data Representation

- Programs and data in a computer are represented in binary format
  - 1 bit (binary digit), 2 possible values
    - 0 (false, "no", power off, "empty", ...)
    - 1 (true, "yes", power on, "solid", ...)
  - 1 byte = 8 bits ( $2^8 = 256$  values)
    - in C, type `char` equals one byte\*
  - 1 word = 4 bytes\* ( $2^{32} = 4294967296$  values)
    - in C, type `int` equals one word
- Memory size is measured in Bytes
  - 1 KB = 1024 byte = 1 "kilo byte"
  - 1 MB = 1024\*1024 byte = 1 "mega byte"
  - 1 GB = 1024\*1024\*1024 byte = 1 "giga byte"

(\*architecture dependent!)

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

31

## Binary Data Representation

- Memory is composed of addressable bytes

- Example:  
1 KB of memory
- What is the value at  
address 7?

$$\begin{aligned}
 & 7 \quad \square \blacksquare \square \square \blacksquare \blacksquare \square \blacksquare \\
 & 7 \ 6 \ 5 \ 4 \ 3 \ 2 \ 1 \ 0 \\
 & = 0 * 2^7 + 1 * 2^6 + 0 * 2^5 + 0 * 2^4 \\
 & + 1 * 2^3 + 1 * 2^2 + 0 * 2^1 + 1 * 2^0 \\
 & = 0 * 128 + 1 * 64 + 0 * 32 + 0 * 16 \\
 & + 1 * 8 + 1 * 4 + 0 * 2 + 1 * 1 \\
 & = 64 + 8 + 4 + 1 \\
 & = 77
 \end{aligned}$$

32

## Binary Data Representation

- Number Systems
  - DEC: Decimal numbers
    - Base 10, digits 0, 1, 2, 3, ..., 9
    - e.g.  $157 = 1 \cdot 10^2 + 5 \cdot 10^1 + 7 \cdot 10^0$
  - BIN: Binary numbers
    - Base 2, digits 0, 1
    - e.g.  $10011101_2 = 1 \cdot 2^7 + 0 \cdot 2^6 + \dots + 1 \cdot 2^0$
  - OCT: Octal numbers
    - Base 8, digits 0, 1, 2, 3, ..., 7
    - e.g.  $235_8 = 2 \cdot 8^2 + 3 \cdot 8^1 + 5 \cdot 8^0$
  - HEX: Hexadecimal numbers
    - Base 16, digits 0, 1, 2, 3, ..., 9, A, B, C, ..., F
    - e.g.  $9D_{16} = 9 \cdot 16^1 + 13 \cdot 16^0$

## Binary Data Representation

- Number Systems

| DEC | BIN  | OCT | HEX |
|-----|------|-----|-----|
| 0   | 0000 | 0   | 0   |
| 1   | 0001 | 1   | 1   |
| 2   | 0010 | 2   | 2   |
| 3   | 0011 | 3   | 3   |
| 4   | 0100 | 4   | 4   |
| 5   | 0101 | 5   | 5   |
| 6   | 0110 | 6   | 6   |
| 7   | 0111 | 7   | 7   |
| 8   | 1000 | 10  | 8   |
| 9   | 1001 | 11  | 9   |
| 10  | 1010 | 12  | A   |
| 11  | 1011 | 13  | B   |
| 12  | 1100 | 14  | C   |
| 13  | 1101 | 15  | D   |
| 14  | 1110 | 16  | E   |
| 15  | 1111 | 17  | F   |

## Binary Data Representation

- Number Systems (signed vs. unsigned)

| SDEC | UDEC | BIN  | OCT | HEX |
|------|------|------|-----|-----|
| 0    | 0    | 0000 | 0   | 0   |
| 1    | 1    | 0001 | 1   | 1   |

## Binary Data Representation

- Number Systems

- Signed representation: *two's complement*

- to obtain the negative of any number in binary representation, ...
    - ... invert all bits,
    - ... and add 1

- Example: 4-bit two's complement

| SDEC | UDEC | BIN  | OCT | HEX |
|------|------|------|-----|-----|
| ...  | ...  | ...  | ... | ... |
| 7    | 7    | 0111 | 7   | 7   |
| -8   | 8    | 1000 | 10  | 8   |
| -7   | 9    | 1001 | 11  | 9   |
| ...  | ...  | ...  | ... | ... |

(c) 2007 R. Doemer

36

## Memory Organization

- Memory Segmentation
  - typical (virtual) memory layout on processor with 4-byte words and 1 GB of memory
  - Stack
    - grows and shrinks dynamically
    - function call hierarchy
    - stack frames with local variables
  - Heap
    - “free” storage
    - dynamic allocation by the user
  - Data segment
    - global (and static) variables
  - Program segment
    - stores binary program code
  - Reserved area for operating system

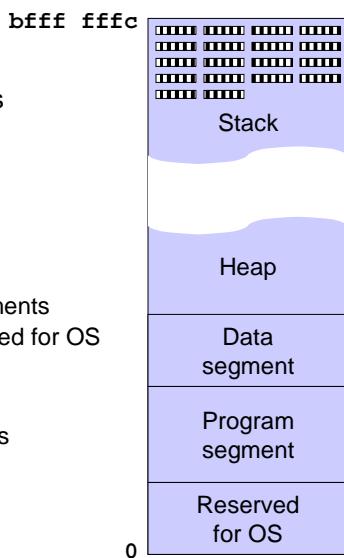

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

37

## Memory Organization

- Memory Segmentation
  - typical (virtual) memory layout on processor with 4-byte words and 1 GB of memory
- Memory errors
  - *Out of memory*
    - Stack and heap collide
  - *Segmentation fault*
    - access outside allocated segments
    - e.g. access to segment reserved for OS
  - *Bus error*
    - mis-aligned word access
    - e.g. word access to an address that is not divisible by 4

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

38

## Objects in Memory

- Data in memory is organized as a set of objects
- Every object has ...
  - ... a **type** (e.g. `int`, `double`, `char[5]`)
    - type is known to the compiler at compile time
  - ... a **value** (e.g. `42`, `3.1415`, `"text"`)
    - value is used for computation of expressions
  - ... a **size** (number of bytes in the memory)
    - in C, the `sizeof` operator returns the size of a variable or type
  - ... a **location** (address in the memory)
    - in C, the “address-of” operator (`&`) returns the address of an object
- Variables ...
  - ... serve as identifiers for objects
  - ... are bound to objects
  - ... give objects a name

## Objects in Memory

- Example: Variable values, addresses, and sizes

```

int x = 42;
int y = 13;
char s[] = "Hello World!";

printf("Value of x is %d.\n", x);
printf("Address of x is %p.\n", &x);
printf("Size of x is %u.\n", sizeof(x));
printf("Value of y is %d.\n", y);
printf("Address of y is %p.\n", &y);
printf("Size of y is %u.\n", sizeof(y));
printf("Value of s is %s.\n", s);
printf("Address of s is %p.\n", &s);
printf("Size of s is %u.\n", sizeof(s));
printf("Value of s[1] is %c.\n", s[1]);
printf("Address of s[1] is %p.\n", &s[1]);
printf("Size of s[1] is %u.\n", sizeof(s[1]));

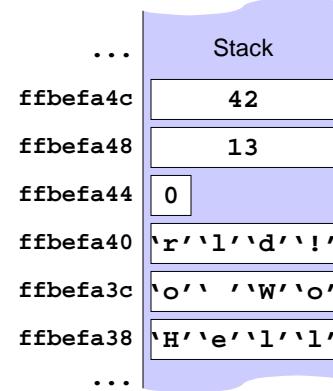

```

## Objects in Memory

- Example: Variable values, addresses, and sizes

```
int x = 42;
int y = 13;
char s[] = "Hello World!";
...
```

```
Value of x is 42.
Address of x is ffbefa4c.
Size of x is 4.
Value of y is 13.
Address of y is ffbefa48.
Size of y is 4.
Value of s is Hello World!.
Address of s is ffbefa38.
Size of s is 13.
Value of s[1] is e.
Address of s[1] is ffbefa39.
Size of s[1] is 1.
```

## Pointers

- Pointers are variables whose values are *addresses*
  - The “address-of” operator (`&`) returns a pointer!
- Pointer Definition
  - The unary `*` operator indicates a pointer type in a definition

```
int x = 42; /* regular integer variable */
int *p; /* pointer to an integer */
```

- Pointer initialization or assignment
  - A pointer may be set to the “address-of” another variable
  - `p = &x; /* p points to x */`
  - A pointer may be set to 0 (points to no object)
  - `p = 0; /* p points to no object */`
  - A pointer may be set to **NULL** (points to “NULL” object)
  - `#include <stdio.h> /* defines NULL as 0 */
p = NULL; /* p points to no object */`

## Pointers

- Pointer Dereferencing

- The unary \* operator dereferences a pointer to the value it points to (“content-of” operator)

```
#include <stdio.h>
int x = 42; /* regular integer variable */
int *p = NULL; /* pointer to an integer */
```

**p**

0

**x**

42

## Pointers

- Pointer Dereferencing

- The unary \* operator dereferences a pointer to the value it points to (“content-of” operator)

```
#include <stdio.h>
int x = 42; /* regular integer variable */
int *p = NULL; /* pointer to an integer */
p = &x; /* make p point to x */
printf("x is %d, content of p is %d\n", x, *p);
```

x is 42, content of p is 42

**p****x**

42

## Pointers

- Pointer Dereferencing

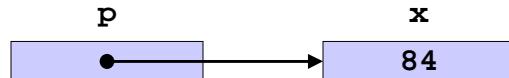

- The unary \* operator dereferences a pointer to the value it points to (“content-of” operator)

```
#include <stdio.h>

int x = 42; /* regular integer variable */
int *p = NULL; /* pointer to an integer */

p = &x; /* make p point to x */
printf("x is %d, content of p is %d\n", x, *p);
*p = 2 * *p; /* multiply content of p by 2 */
printf("x is %d, content of p is %d\n", x, *p);
```

```
x is 42, content of p is 42
x is 84, content of p is 84
```

## Pointers

- Pointer Dereferencing

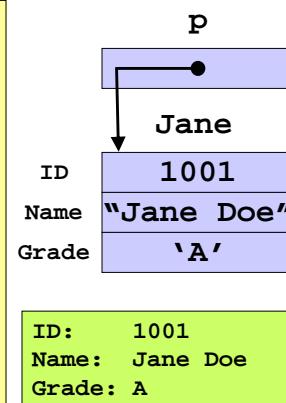

- The -> operator dereferences a pointer to a structure to the content of a structure member

```
struct Student
{
    int ID;
    char Name[40];
    char Grade;
};

struct Student Jane =
{1001, "Jane Doe", 'A'};

struct Student *p = &Jane;

void PrintStudent(void)
{
    printf("ID:      %d\n", p->ID);
    printf("Name:    %s\n", p->Name);
    printf("Grade:   %c\n", p->Grade);
}
```

## Pointers

- Pointer Arithmetic
  - Pointers pointing into arrays may be ...
    - ... incremented to point to the next array element
    - ... decremented to point to the previous array element

```
int x[5] = {10,20,30,40,50}; /* array of 5 integers */
int *p;                      /* pointer to integer */

p = &x[1];                  /* point p to x[1] */
printf("%d, ", *p);          /* print content of p */
p++;                        /* increment p by 1 */
printf("%d, ", *p);          /* print content of p */
p--;                        /* decrement p by 1 */
printf("%d, ", *p);          /* print content of p */
p += 2;                     /* increment p by 2 */
printf("%d, ", *p);          /* print content of p */
```

20, 30, 20, 40,

## Pointers

- Pointer Comparison
  - Pointers may be compared for equality
    - operators == and != are useful to determine *identity*
    - operators <, <=, >=, and > are *not* applicable

```
int x[5] = {10,20,10,20,10}; /* array of 5 integers */
int *p1, *p2;                /* pointers to integer */

p1 = &x[1]; p2 = &x[3];      /* point to x[1], x[3] */

if (p1 == p2)
{ printf("p1 and p2 are identical!\n");
}
if (*p1 == *p2)
{ printf("Contents of p1 and p2 are the same!\n");
}
```

Contents of p1 and p2 are the same!

## Pointers

- Pointer Comparison
  - Pointers may be compared for equality
    - operators == and != are useful to determine *identity*
    - operators <, <=, >=, and > are *not* applicable

```
int x[5] = {10,20,10,20,10}; /* array of 5 integers */
int *p1, *p2;                /* pointers to integer */

p1 = &x[1]; p2 = &x[3];        /* point to x[1], x[3] */
p1 += 2;                      /* increment p1 by 2 */
if (p1 == p2)
{ printf("p1 and p2 are identical!\n");
}
if (*p1 == *p2)
{ printf("Contents of p1 and p2 are the same!\n");
}
```

p1 and p2 are identical!  
Contents of p1 and p2 are the same!

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

49

## Pointers

- String Operations using Pointers
  - Example: String length

```
int Length(char *s)
{
    int l = 0;
    char *p = s;

    while(*p != 0)
    { p++;
        l++;
    }
    return l;
}
```

```
char s1[] = "ABC";
char s2[] = "Hello World!";

printf("Length of %s is %d\n",
       s1, Length(&s1[0]));
printf("Length of %s is %d\n",
       s2, Length(&s2[0]));

Length of ABC is 3
Length of Hello World! is 12
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

50

## Pointers

- String Operations using Pointers

- Example: String length

```
int Length(char *s)
{
    int l = 0;
    char *p = s;

    while(*p != 0)
    { p++;
        l++;
    }
    return l;
}
```

```
char s1[] = "ABC";
char s2[] = "Hello World!";

printf("Length of %s is %d\n",
       s1, Length(&s1[0]));
printf("Length of %s is %d\n",
       s2, Length(s2));

Length of ABC is 3
Length of Hello World! is 12
```

- Array and pointer types are equivalent

- $\mathbf{s2}$  is an array, but can be passed as a pointer argument
    - Character array  $\mathbf{s2}$  is same as character pointer  $\&\mathbf{s2}[0]$

## Pointers

- String Operations using Pointers

- Example: String length

```
int Length(char *s)
{
    int l = 0;
    char *p = s;

    while(*p != 0)
    { p++;
        l++;
    }
    return l;
}
```

```
char s1[] = "ABC";
char *s2 = "Hello World!";

printf("Length of %s is %d\n",
       s1, Length(s1));
printf("Length of %s is %d\n",
       s2, Length(s2));

Length of ABC is 3
Length of Hello World! is 12
```

- Array and pointer types are equivalent

- $\mathbf{s1}$  is an array of characters,  $\mathbf{s2}$  is a pointer to character
    - Both  $\mathbf{s1}$  and  $\mathbf{s2}$  can be passed to character pointer  $\mathbf{s}$

## Pointers

- String Operations using Pointers

- Example: String length

```
int Length(char s[])
{
    int l = 0;
    char *p = s;

    while(*p != 0)
    { p++;
        l++;
    }
    return l;
}
```

```
char s1[] = "ABC";
char *s2 = "Hello World!";

printf("Length of %s is %d\n",
       s1, Length(s1));
printf("Length of %s is %d\n",
       s2, Length(s2));
```

```
Length of ABC is 3
Length of Hello World! is 12
```

- Array and pointer types are equivalent

- **s1** is an array of characters, **s2** is a pointer to character
- Both **s1** and **s2** can be passed to character array **s**

## Pointers

- String Operations using Pointers

- Example: String copy

```
void Copy(
    char *Dst,
    char *Src)
{
    do{
        *Dst = *Src;
        Dst++;
    } while(*Src++);
}
```

```
char s1[] = "ABC";
char s2[] = "Hello World!";

printf("s1 is %s, s2 is %s\n",
       s1, s2);
Copy(s2, s1);
printf("s1 is %s, s2 is %s\n",
       s1, s2);
```

```
s1 is ABC, s2 is Hello World!
s1 is ABC, s2 is ABC
```

- Passing pointers as arguments to functions

- Function can modify caller data by pointer dereferencing
- **Passing pointers = Pass by reference!**

## Pointers

- String Operations using Pointers

- Example: String copy

```
void Copy(
    char *Dst,
    const char *Src)
{
    do{
        *Dst = *Src;
        Dst++;
    } while(*Src++);
}
```

```
char s1[] = "ABC";
char s2[] = "Hello World!";

printf("s1 is %s, s2 is %s\n",
       s1, s2);
Copy(s2, s1);
printf("s1 is %s, s2 is %s\n",
       s1, s2);
```

s1 is ABC, s2 is Hello World!  
s1 is ABC, s2 is ABC

- Passing pointers as arguments to functions

- Function can modify caller data by pointer dereferencing
    - Type qualifier **const**:  
Modification by pointer derefencing *not allowed!*

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

55

## Pointers

- String Operations using Pointers

- Example: String copy

```
void Copy(
    const char *Dst,
    const char *Src)
{
    do{
        *Dst = *Src;
        Dst++;
    } while(*Src++);
}
```

Error!  
Write access to  
**const** data!

```
char s1[] = "ABC";
char s2[] = "Hello World!";

printf("s1 is %s, s2 is %s\n",
       s1, s2);
Copy(s2, s1);
printf("s1 is %s, s2 is %s\n",
       s1, s2);
```

s1 is ABC, s2 is Hello World!  
s1 is ABC, s2 is ABC

- Passing pointers as arguments to functions

- Function can modify caller data by pointer dereferencing
    - Type qualifier **const**:  
Modification by pointer derefencing *not allowed!*

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

56

## Standard Library Functions

- Functions declared in **string.h** (part 1/2)

- `typedef unsigned int size_t;`
  - type definition for length of strings
- `size_t strlen(const char *s);`
  - returns the length of string **s**
- `int strcmp(const char *s1, const char *s2);`
  - alphabetically compares string **s1** with string **s2**
  - returns -1 / 0 / 1 for less-than / equal-to / greater-than
- `int strncmp(const char *s1, const char *s2, size_t n);`
  - same as previous, but compares maximal **n** characters
- `int strcasecmp(const char *s1, const char *s2);`
- `int strncasecmp(const char *s1, const char *s2, size_t n);`
  - same as string comparisons above, but case-insensitive

## Standard Library Functions

- Functions declared in **string.h** (part 2/2)

- `char *strcpy(char *s1, const char *s2);`
  - copies string **s2** into string **s1**
- `char *strncpy(char *s1, const char *s2, size_t n);`
  - copies maximal **n** characters of string **s2** into string **s1**
- `char *strcat(char *s1, const char *s2);`
  - concatenates string **s2** to string **s1**
- `char *strncat(char *s1, const char *s2, size_t n);`
  - concatenates maximal **n** characters of string **s2** to string **s1**
- `char *strchr(const char *s, int c);`
  - returns a pointer to the first character **c** in string **s**, or **NULL** if not found
- `char * strrchr(const char *s, int c);`
  - returns a pointer to the last character **c** in string **s**, or **NULL** if not found
- `char *strstr(const char *s1, const char *s2);`
  - returns a pointer to the first appearance of **s2** in string **s1** (or **NULL**)

## File Processing

- Introduction
  - Up to now, all data processed is available only during program run time
    - At program completion, all data is lost
  - *Persistent data* is stored even after a program exits
  - Persistent data is stored in files...
    - ... on the harddisk
    - ... on a removable disk (CD, memory stick, ...)
    - ... on a tape, ...
  - Input and output from/to files is organized as *I/O streams*

## File Processing

- I/O Streams
  - Standard I/O streams (opened by the system)
    - `stdin` standard input stream (i.e. `scanf()`)
    - `stdout` standard output stream (i.e. `printf()`)
    - `stderr` standard error stream (i.e. `perror()`)
  - File I/O streams (explicitly opened by a program)
    - Open a file `fopen()`
    - Write data to a file `fprintf()`, `fputs()`, etc.
    - Read data from a file `fscanf()`, `fgets()`, etc.
    - Close a file `fclose()`
  - In C, all I/O functions are ...
    - ... declared in header file `stdio.h`
    - ... implemented in the standard C library

## Standard I/O Functions

- Functions declared in `stdio.h` (part 1/4)

- `int printf(const char *fmt, ...);`
- `int scanf(const char *fmt, ...);`
  - formatted output/input to/from stream `stdin/stdout`
- `int sprintf(char *s, const char *fmt, ...);`
- `int sscanf(const char *s, const char *fmt, ...);`
  - formatted output/input to/from a string `s`
- `int getchar(void);`
- `int putchar(int c);`
  - input/output of a single character to/from stream `stdin/stdout`
- `char *gets(char *s);`
- `int puts(const char *s);`
  - input/output of strings to/from stream `stdin/stdout`

## Standard I/O Functions

- Functions declared in `stdio.h` (part 2/4)

- `typedef __FILE FILE;`
  - opaque type for a file handle
- `FILE *fopen(const char *n, const char *m);`
  - open file named `n` for input ("r"), output ("w"), or append ("a")
  - returns a file handle, or `NULL` in case of an error
- `int fclose(FILE *f);`
  - closes an open file handle
- `int fprintf(FILE *f, const char *fmt, ...);`
- `int fscanf(FILE *f, const char *fmt, ...);`
- `int fgetc(FILE *f);`
- `char *fgets(char *s, int n, FILE *f);`
- `int fputc(int c, FILE *f);`
- `int fputs(const char *s, FILE *f);`
  - input/output functions from/to stream `f`
- `int fflush(FILE *f);`
  - flushes any unwritten data from a buffer into the file

## Standard I/O Functions

- Functions declared in `stdio.h` (part 3/4)

- `typedef unsigned int size_t;`
  - type for size of a block of memory (number of bytes)
- `size_t fread(void *p, size_t s, size_t n, FILE *f);`
  - binary input to memory location `p` for `n` times `s` bytes from file `f`
- `size_t fwrite(const void *p, size_t s, size_t n, FILE *f);`
  - binary output from memory location `p` for `n` times `s` bytes to file `f`
- `int fseek(FILE *f, long pos, int w);`
  - move to position `pos` in file `f` (from beginning/current pos/end)
- `long ftell(FILE *f);`
  - return the current position in file `f` (from beginning)
- `void rewind(FILE *f);`
  - move to beginning of file `f`
- `int feof(FILE *f);`
  - check if end of file `f` is reached

## Standard Library Functions

- Functions declared in `stdio.h` (part 4/4)

- `int ferror(FILE *f);`
  - returns the current error status for file `f`
- `void perror(const char *prg);`
  - print current error for program `prg` to stream `stderr`
- `int remove(const char *filename);`
  - delete file `filename`
- `int rename(const char *old, const char *new);`
  - rename file `old` to new name `new`

## File Processing

- Program example: **PhotoLab**
  - Digital image manipulation
    - Read an image from a file
    - Manipulate the image in memory
    - Write the modified image to file
  - Portable Pixel Map (PPM) file format
    - simple uncompressed file format for color images
    - Header section (including picture width, height)
    - Data section (pixel values in Red/Green/Blue format)

```
P6
800 450
255
RGBRGBRGB...
```

## File Processing

- Program example: **PhotoLab.c** (part 1/10)

```
*****
/* PhotoLab.c: final assignment for EECS 10 in Fall 2007 */
/*
 * modifications: (most recent first)
 * 12/01/07 RD adjusted for lecture usage
 */
****

#include <stdio.h>
#include <stdlib.h>

/** global definitions **/

#define WIDTH 800      /* image width */
#define HEIGHT 450     /* image height */
#define SLEN 80        /* max. string length */

...
```

## File Processing

- Program example: **PhotoLab.c** (part 2/10)

```

...
/** function definitions */
/* write the RGB image to a PPM file */
/* (return 0 for success, >0 for error) */
int SaveImage(char fname[SLEN],
              unsigned char R[WIDTH][HEIGHT],
              unsigned char G[WIDTH][HEIGHT],
              unsigned char B[WIDTH][HEIGHT])
{
    FILE *File;
    int x, y;
    File = fopen(fname, "w");
    if (!File)
    {
        printf("\nCannot open file \"%s\"!\n", fname);
        return(1);
    }
    ...

```

## File Processing

- Program example: **PhotoLab.c** (part 3/10)

```

...
fprintf(File, "P6\n");
fprintf(File, "%d %d\n", WIDTH, HEIGHT);
fprintf(File, "255\n");
for(y=0; y<HEIGHT; y++)
{
    for(x=0; x<WIDTH; x++)
    {
        fputc(R[x][y], File);
        fputc(G[x][y], File);
        fputc(B[x][y], File);
    }
}
if (ferror(File))
{
    printf("\nFile error while writing to file!\n");
    return(2);
}
fclose(File);
return(0); /* success! */
} /* end of SaveImage */
...

```

## File Processing

- Program example: **PhotoLab.c** (part 4/10)

```
...
/* read an image file into the RGB data structure */
/* (return 0 for success, >0 for error) */

int ReadImage(char fname[SLEN],
              unsigned char R[WIDTH][HEIGHT],
              unsigned char G[WIDTH][HEIGHT],
              unsigned char B[WIDTH][HEIGHT])
{
    FILE *File;
    char Type[SLEN];
    int Width, Height, MaxValue, x, y;

    File = fopen(fname, "r");
    if (!File)
    {
        printf("\nCannot open file \"%s\"!\n", fname);
        return(1);
    }
    ...
}
```

## File Processing

- Program example: **PhotoLab.c** (part 5/10)

```
...
fscanf(File, "%79s", Type);
if (Type[0] != 'P' || Type[1] != '6' || Type[2] != 0)
{
    printf("\nUnsupported file format!\n");
    return(2);
}
fscanf(File, "%d", &Width);
if (Width != WIDTH)
{
    printf("\nUnsupported image width %d!\n", Width);
    return(3);
}
fscanf(File, "%d", &Height);
if (Height != HEIGHT)
{
    printf("\nUnsupported image height %d!\n", Height);
    return(4);
}
...
}
```

## File Processing

- Program example: **PhotoLab.c** (part 6/10)

```
...
fscanf(File, "%d", &MaxValue);
if (MaxValue != 255)
{
    printf("\nUnsupported maximum %d!\n", MaxValue);
    return(5);
}
if ('\n' != fgetc(File))
{
    printf("\nCarriage return expected!\n");
    return(6);
}
for(y=0; y<HEIGHT; y++)
{
    for(x=0; x<WIDTH; x++)
    {
        R[x][y] = fgetc(File);
        G[x][y] = fgetc(File);
        B[x][y] = fgetc(File);
    }
}
...
```

## File Processing

- Program example: **PhotoLab.c** (part 7/10)

```
...
if (ferror(File))
{
    printf("\nFile error while reading from file!\n");
    return(7);
}
fclose(File);
return(0); /* success! */
} /* end of ReadImage */

...
```

## File Processing

- Program example: **PhotoLab.c** (part 8/10)

```
...
/* modify the image...  ;-)
void ModifyImage(unsigned char R[WIDTH][HEIGHT],
                 unsigned char G[WIDTH][HEIGHT],
                 unsigned char B[WIDTH][HEIGHT])
{
    int x, y;

    for(y=0; y<HEIGHT; y++)
    {
        for(x=0; x<WIDTH; x++)
        {
            R[x][y] = R[x][(HEIGHT+y)/2];
            G[x][y] = G[x][(HEIGHT+y)/2];
            B[x][y] = B[x][(HEIGHT+y)/2];
        }
    }

} /* end of ModifyImage */
...
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

73

## File Processing

- Program example: **PhotoLab.c** (part 9/10)

```
...
/** main program ***/

int main(void)
{
    /* image data */
    unsigned char R[WIDTH][HEIGHT];
    unsigned char G[WIDTH][HEIGHT];
    unsigned char B[WIDTH][HEIGHT];
    /* file name */
    char fname[SLEN];

    ...
}
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

74

## File Processing

- Program example: **PhotoLab.c** (part 10/10)

```

...
printf("Enter input file name: ");
scanf("%79s", fname);
if (ReadImage(fname, R,G,B) != 0)
{ exit(10); }

/* modify the image */
ModifyImage(R, G, B);

printf("Enter output file name: ");
scanf("%79s", fname);
if (SaveImage(fname, R,G,B) != 0)
{ exit(10); }

return 0;
} /* end of main */

/* EOF */

```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

75

## File Processing

- Example session:

```

% vi PhotoLab.c
% gcc PhotoLab.c -o PhotoLab -Wall -ansi
% PhotoLab
Enter input file name: imgColor.ppm
Enter output file name: newFile.ppm
%

```

imgColor.ppm

newFile.ppm

## Translation Units

- Introduction
  - C compilation process is a sequence of phases
    - Preprocessing (handle # directives)
    - Scanning and parsing (generate internal data structure)
    - Instruction generation (emit stream of CPU instructions)
    - Assembly (generate binary object file)
    - Linking (combine objects into executable file)
  - C compiler consists of separate components
    - Preprocessor (processes # directives)
    - Compiler (compiles and assembles code)
    - Linker (processes object files and libraries)

## Translation Units

- Compilation Phases
  - Source code
    - Program file
    - Header file(s)
  - Preprocessed file
  - Object file
  - Library file(s)
  - Executable file

## Translation Units

- Source files
  - Header files: **Program.h**
    - Inclusion of required header files
    - Definitions of exported constants
    - Declarations of exported global variables
    - Declarations of exported functions
  - Program files: **Program.c**
    - Inclusion of required header files
    - Declaration and definition of local variables
    - Declaration and definition of local functions
    - Definitions of exported global variables
    - Definitions of exported functions

## Translation Units

- C Preprocessor
  - preprocesses source files
  - handles # directives
- Preprocessing Directives
  - Constant definition
  - Macro definition
  - Header file inclusion
  - Conditional compilation

```
#define WIDTH 800
#define ABS(x) (x>0 ? x : -x)
#include <stdio.h>

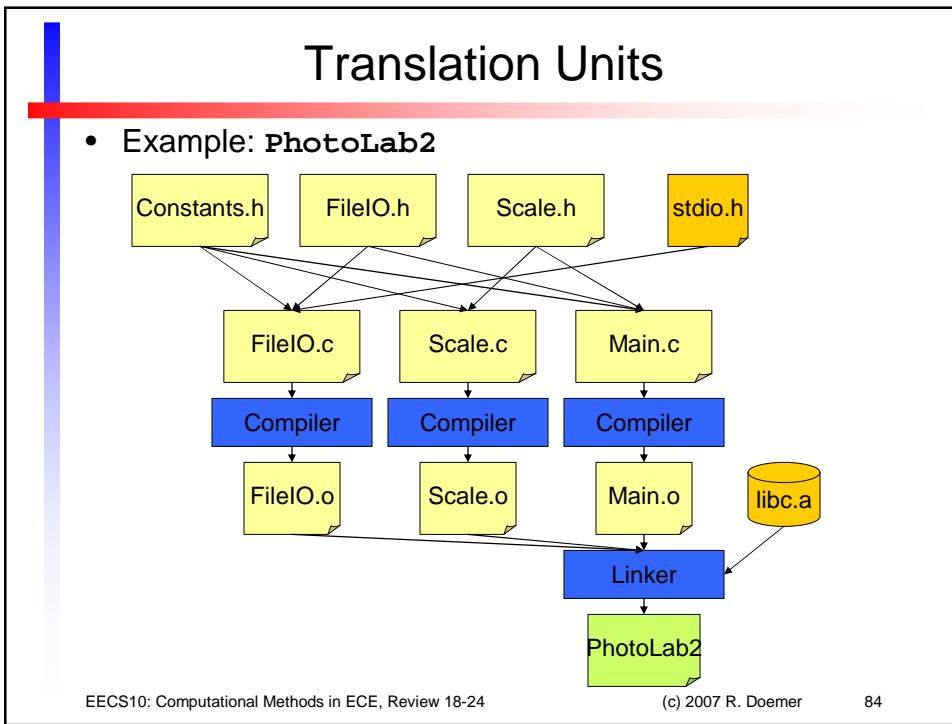

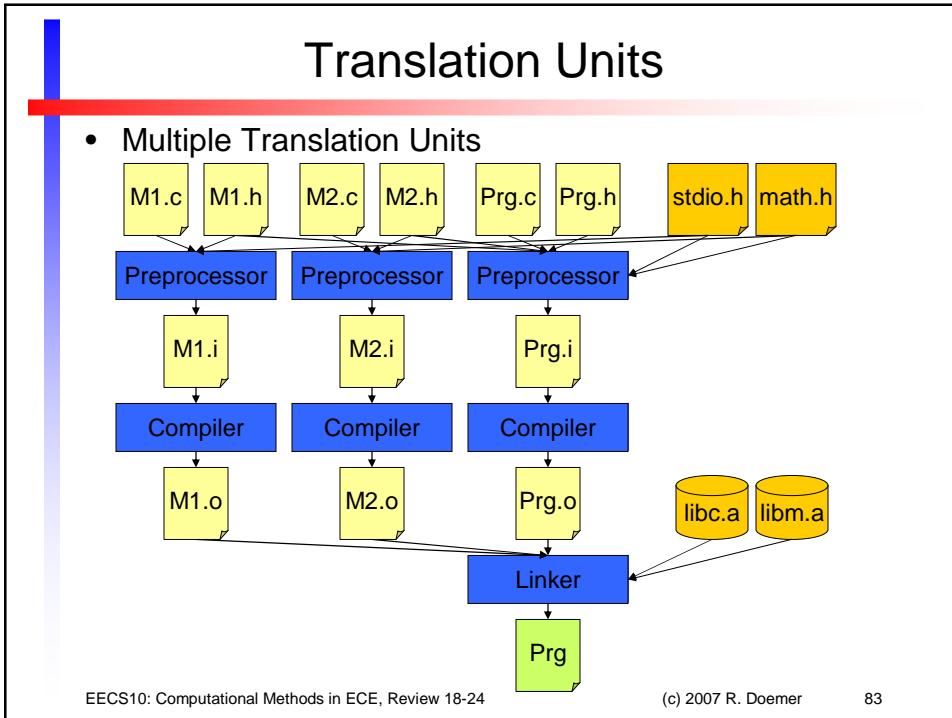

#define DEBUG /* comment out to turn debugging off */
...
#endif
#define DEBUG
printf("value of x is now %d\n", x);
#endif
```

## Translation Units

- Object files
  - **Program.o**
    - Compiled object code of source file **Program.c**
    - Use option `-c` in GNU compiler call to create object files  
`gcc -c Program.c -o Program.o -Wall -ansi`
  - **Library.a**
    - Archive of compiled object files
- Executable file
  - **Program**
    - Object files and libraries linked together into a complete file ready for execution
    - GNU compiler recognizes object files by .o suffix, so object files and libraries require no special option  
`gcc Program.o -lc -lm -o Program`

## Translation Units

- Multiple Translation Units
  - C programs can be partitioned into multiple translation units, aka. *modules*
  - Modules typically consist of
    - Module header file (file suffix `.h`)
    - Module program file (file suffix `.c`)
    - Module object file (file suffix `.o`)
  - Modules are *linked* together
    - Linker combines object files and required libraries into an executable file
    - `gcc Program.o Mod1.o Mod2.o -lc -lm -o Program`

## Translation Units

- Example: Header file **Constants.h**

```
*****  
/* Constants.h: header file for constant definitions */  
/* author: Rainer Doemer */  
/* modifications: (most recent first) */  
/* 12/02/07 RD version for Fall 2007 */  
*****  
  
#ifndef CONSTANTS_H  
#define CONSTANTS_H  
  
/** global definitions **/  
  
#define WIDTH 800      /* image width */  
#define HEIGHT 450     /* image height */  
#define SLEN    80      /* max. string length */  
  
#endif /* CONSTANTS_H */  
  
/* EOF Constants.h */
```

EECS10: Computational Methods in ECE, Review 18-24

(c) 2007 R. Doemer

85

## Translation Units

- Example: Header file **FileIO.h**

```
*****  
/* FileIO.h: header file for I/O module */  
*****  
#ifndef FILE_IO_H  
#define FILE_IO_H  
  
#include "Constants.h"  
  
int ReadImage(      /* read image from file */  
    char Filename[SLEN],  
    unsigned char R[WIDTH][HEIGHT],  
    unsigned char G[WIDTH][HEIGHT],  
    unsigned char B[WIDTH][HEIGHT]);  
  
int SaveImage(      /* write image to file */  
    char Filename[SLEN],  
    unsigned char R[WIDTH][HEIGHT],  
    unsigned char G[WIDTH][HEIGHT],  
    unsigned char B[WIDTH][HEIGHT]);  
  
#endif /* FILE_IO_H */  
/* EOF FileIO.h */
```

EECS10: Computational Methods in ECE, Review 18-24

## Translation Units

- Example: Program file **FileIO.c**

```
/***
/* FileIO.c: program file for I/O module      */
/**

#include <stdio.h>
#include "FileIO.h"

/** function definitions **/

int ReadImage(char Filename[SLEN],
               unsigned char R[WIDTH][HEIGHT],
               unsigned char G[WIDTH][HEIGHT],
               unsigned char B[WIDTH][HEIGHT])
{
    /* ... function body ... */
}

int SaveImage(char Filename[SLEN],
               unsigned char R[WIDTH][HEIGHT],
               unsigned char G[WIDTH][HEIGHT],
               unsigned char B[WIDTH][HEIGHT])
{
    /* ... function body ... */
}

EECS /* EOF FileIO.c */
```

## Translation Units

- Example: Header file **Scale.h**

```
/***
/* Scale.h: header file for scaling operation   */
/**

#ifndef SCALE_H
#define SCALE_H

/** header files **/

#include "Constants.h"

/** function declarations **/

void Scale(     /* scale the image */
              unsigned char R[WIDTH][HEIGHT],
              unsigned char G[WIDTH][HEIGHT],
              unsigned char B[WIDTH][HEIGHT],
              double       scaleFactor);

#endif /* SCALE_H */

/* EOF Scale.h */
```

## Translation Units

- Example: Program file **Scale.c**

```
/***/
/* Scale.c: program file for scaling operation */
/***/

#include "Scale.h"

/** function definitions **/
/* scale the image vertically */

void Scale(
    unsigned char R[WIDTH][HEIGHT],
    unsigned char G[WIDTH][HEIGHT],
    unsigned char B[WIDTH][HEIGHT],
    double      scaleFactor)
{
    /* ... function body ... */
}

/* EOF Scale.c */
```

## Translation Units

- Example: Program file **Main.c**

```
/***/
/* Main.c: main program file */
/***/

#include "Constants.h"
#include "FileIO.h"
#include "Scale.h"

int main(void)
{
    unsigned char R[WIDTH][HEIGHT];
    unsigned char G[WIDTH][HEIGHT];
    unsigned char B[WIDTH][HEIGHT];

    if(ReadImage("Input.ppm", R, G, B) != 0)
    {
        exit(10);
    }
    Scale(R, G, B, 2.0);
    if (SaveImage("Output.ppm", R, G, B) != 0)
    {
        exit(10);
    }

    return 0;
} /* end of main */
/* EOF Main.c */
```

## Translation Units

- Example session:

```
% vi Constants.h  
% vi FileIO.h  
% vi FileIO.c  
% vi Scale.h  
% vi Scale.c  
% vi Main.c  
  
% gcc -c FileIO.c -o FileIO.o -Wall -ansi  
% gcc -c Scale.c -o Scale.o -Wall -ansi  
% gcc -c Main.c -o Main.o -Wall -ansi  
% gcc FileIO.o Scale.o Main.o -o PhotoLab2  
% PhotoLab2  
%
```
