Functions

- Review: Terms and Concepts
 - Function declaration
 - function prototype with name, parameters, and return type
 - Function parameters
 - formal parameters holding the data supplied to a function
 - Function definition
 - extended declaration, defines the behavior in function body
 - Local variables
 - variables defined locally in a function body
 - Function call
 - expression invoking a function with supplied arguments
 - Function arguments
 - arguments passed to a function call (initial values for parameters)
 - Return value
 - result computed by a function call

Functions

- **Scope of an identifier**
 - Portion of the program where the identifier can be referenced
 - aka. accessibility, visibility
- **Scope rules**
 - Global variables: *file scope*
 - Declaration outside any function (at global level)
 - Scope in entire source file after declaration
 - Function parameters: *function scope*
 - Declaration in function parameter list
 - Scope limited to this function body (entirely)
 - Local variables: *block scope*
 - Declaration inside a compound statement (i.e. function body)
 - Scope limited to this compound statement block (entirely)

Debugging

- Source-level Debugger **gdb**
 - Basic **gdb** commands
 - **run**
 - starts the execution of the program in the debugger
 - **break *function_name***
 - inserts a breakpoint at *function_name*
 - program execution will stop at the breakpoint
 - **list *line_numbers***
 - lists the current or specified *line_numbers*
 - **print *variable_name***
 - prints the current value of the variable *variable_name*
 - **next**
 - executes the next statement (one statement at a time)
 - **quit**
 - exits the debugger (and terminates the program)
 - **help**
 - provides helpful details on debugger commands

18

Debugging

- Source-level Debugger `gdb` (continued)
 - Additional `gdb` commands
 - `step`
 - steps into a function call
 - `finish`
 - continues execution until the current function is finished
 - `where`
 - shows where in the function call hierarchy you are
 - prints a *back trace* of current *stack frames*
 - `up`
 - steps up one stack frame (up into the caller)
 - `down`
 - steps down one stack frame (down into the callee)
 - `info locals`
 - lists the local variables in the current function (current stack frame)
 - `info scope function_name`
 - lists the variables in scope of the *function_name*
