Electrical Engineering and Computer Science
University of California, Irvine

Lecture 4: Overview

- Our second C Program
 - Program structure
 - Input
 - Computation
 - Output
 - Example `Addition.c`
 - Variables
 - Data input
 - Computation
 - Data output

Program Structure

- General Program Structure
 - Input
 - read input data
 - Computation
 - compute output data from input data
 - Output
 - write output data
- Examples
 - Calculator
 - Enter numbers, compute function, output result
 - Word processor
 - Type, format, print text
 - Database application
 - Enter data, process data, present data
 - etc.

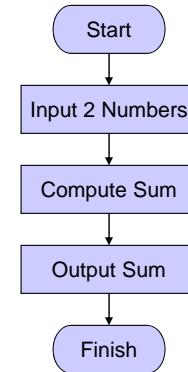

C Program Structure

- Initialization section
 - Definition of variables (storage elements)
 - Name, type, and initial value
- Input section
 - read values from input devices into variables
 - standard input functions
- Computation section
 - perform the necessary computation on variables
 - assignment statements
- Output section
 - write results from variables to output devices
 - standard output functions
- Exit section
 - clean up and exit

Our second C Program

- Program Example: Addition
 - Input
 - Let the user enter two whole numbers
 - Computation
 - Compute the sum of the two numbers
 - Output
 - Display the sum

EECS10: Computational Methods in ECE, Lecture 4

(c) 2010 R. Doemer

5

Our second C Program

- Program example: **Addition.c** (part 1/2)

```

/*
 * Author: Rainer Doemer
 * Modifications:
 * 09/30/04 RD initial version
 */

#include <stdio.h>

/* main function */

int main(void)
{
    /* variable definitions */
    int i1 = 0;           /* first integer */
    int i2 = 0;           /* second integer */
    int sum;              /* result */
    ...
}
  
```

EECS10: Computational Methods in ECE, Lecture 4

(c) 2010 R. Doemer

6

Our second C Program

- Program example: **Addition.c** (part 2/2)

```
...
/* input section */
printf("Please enter an integer:      ");
scanf("%d", &i1);
printf("Please enter another integer: ");
scanf("%d", &i2);

/* computation section */
sum = i1 + i2;

/* output section */
printf("The sum of %d and %d is %d.\n", i1, i2, sum);

/* exit */
return 0;
} /* end of main */

/* EOF */
```

Our second C Program

- Variable definition and initialization

```
/* variable definitions */
int i1 = 0;           /* first integer */
int i2 = 0;           /* second integer */
int sum;              /* result */
```

- Variable type: **int**
 - integer type, stores whole numbers (e.g. -5, 0, 42)
 - many other types exist (**float**, **double**, **char**, ...)
- Variable name: **i1**, **i2**, **sum**
 - valid identifier, i.e. name composed of letters, digits
 - variable name should be descriptive
- Initializer: **= 0**
 - specifies the initial value of the variable
 - optional (if omitted, initial value is undefined)

Our second C Program

- Data input using **scanf()** function

```
/* input section */  
printf("Please enter an integer:      ");  
scanf("%d", &i1);
```

- part of standard I/O library
 - declared in header file **stdio.h**
- reads data from the standard input stream **stdin**
 - **stdin** usually means the keyboard
- converts input data according to format string
 - "%d" indicates that a decimal integer value is expected
- stores result in specified location
 - **&i1** indicates to store at the *address* of variable **i1**

Our second C Program

- Computation using assignment statements

```
/* computation section */  
sum = i1 + i2;
```

- Operator **=** specifies an assignment
 - value of the right-hand side (**i1 + i2**) is assigned to the left-hand side (**sum**)
 - left-hand side is usually a variable
 - right-hand side is a simple or complex expression
- Operator **+** specifies addition
 - left and right arguments are added
 - result is the sum of the two arguments
- Many other operators exist
 - For example, **-**, *****, **/**, **%**, **<**, **>**, **==**, **^**, **&**, **|**, ...

Our second C Program

- Data output using **printf()** function

```
/* output section */
printf("The sum of %d and %d is %d.\n", i1, i2, sum);
```

- part of standard I/O library
 - declared in header file **stdio.h**
- writes data to the standard output stream **stdout**
 - **stdout** usually means the monitor
- converts output data according to format string
 - standard text is copied verbatim to the output
 - “%d” is replaced with a decimal integer value
- takes values from specified arguments
 - **i1** indicates to use the value of the variable **i1**

Our second C Program

- Example session: **Addition.c**

```
% vi Addition.c
% ls -l
-rw----- 1 doemer faculty 702 Sep 30 14:17 Addition.c
% gcc -Wall -ansi Addition.c -o Addition
% ls -l
-rwx----- 1 doemer faculty 6628 Sep 30 16:44 Addition*
-rw----- 1 doemer faculty 702 Sep 30 14:17 Addition.c
% Addition
Please enter an integer: 27
Please enter another integer: 15
The sum of 27 and 15 is 42.
% Addition
Please enter an integer: 123
Please enter another integer: -456
The sum of 123 and -456 is -333.
%
```
