Basic Computer Architecture

- Essential Computer Components
 - Central Processing Unit (CPU)
 - e.g. Intel Pentium, Motorola PowerPC, Sun SPARC, ...
 - Random Access Memory (RAM)
 - storage for program and data, read and write access
 - Read Only Memory (ROM)
 - fixed storage for basic input/output system (BIOS)
 - I/O Units
 - Input/output units connecting to peripherals

The diagram illustrates the basic computer architecture. A 'Clock' block on the left provides a signal to the 'CPU'. The 'CPU' is connected to 'RAM', 'ROM', and 'I/O' blocks. A 'Data Bus' is shown as a horizontal line with arrows pointing to the CPU, RAM, and ROM. An 'Address Bus' is shown as a horizontal line with arrows pointing from the CPU to the RAM and ROM. 'I/O Busses' are shown as two horizontal lines with arrows pointing to and from the I/O block.

Binary Data Representation

- Programs and data in a computer are represented in binary format
 - 1 *bit* (binary digit), 2 possible values
 - 0 (false, “no”, power off, “empty”, ...)
 - 1 (true, “yes”, power on, “solid”, ...)
 - 1 *byte* = 8 bits ($2^8 = 256$ values)
 - in C, type `char` equals one byte*
 - 1 *word* = 4 bytes* ($2^{32} = 4294967296$ values)
 - in C, type `int` equals one word
- Memory size is measured in Bytes
 - 1 KB = 1024 byte = 1 “kilo byte”
 - 1 MB = 1024*1024 byte = 1 “mega byte”
 - 1 GB = 1024*1024*1024 byte = 1 “giga byte”

(*architecture dependent!)
