## File Processing

- Introduction
  - Up to now, all data processed is available only during program run time
    - At program completion, all data is lost
  - *Persistent data* is stored even after a program exits
  - Persistent data is stored in files...
    - ... on the harddisk
    - ... on a removable disk (CD, memory stick, ...)
    - ... on a tape, ...
  - Input and output from/to files is organized as *I/O streams*

## File Processing

- I/O Streams
  - Standard I/O streams (opened by the system)
    - `stdin` standard input stream (i.e. `scanf()`)
    - `stdout` standard output stream (i.e. `printf()`)
    - `stderr` standard error stream (i.e. `perror()`)
  - File I/O streams (explicitly opened by a program)
    - Open a file `fopen()`
    - Write data to a file `fprintf()`, `fputs()`, etc.
    - Read data from a file `fscanf()`, `fgets()`, etc.
    - Close a file `fclose()`
  - In C, all I/O functions are ...
    - ... declared in header file `stdio.h`
    - ... implemented in the standard C library

## Standard I/O Functions

- Functions declared in `stdio.h` (part 1/4)
  - `int printf(const char *fmt, ...);`
  - `int scanf(const char *fmt, ...);`
    - formatted output/input to/from stream `stdin/stdout`
  - `int sprintf(char *s, const char *fmt, ...);`
  - `int sscanf(const char *s, const char *fmt, ...);`
    - formatted output/input to/from a string `s`
  - `int getchar(void);`
  - `int putchar(int c);`
    - input/output of a single character to/from stream `stdin/stdout`
  - `char *gets(char *s);`
  - `int puts(const char *s);`
    - input/output of strings to/from stream `stdin/stdout`

## Standard I/O Functions

- Functions declared in `stdio.h` (part 2/4)
  - `typedef __FILE FILE;`
    - opaque type for a file handle
  - `FILE *fopen(const char *n, const char *m);`
    - open file named `n` for input ("r"), output ("w"), or append ("a")
    - returns a file handle, or `NULL` in case of an error
  - `int fclose(FILE *f);`
    - closes an open file handle
  - `int fprintf(FILE *f, const char *fmt, ...);`
  - `int fscanf(FILE *f, const char *fmt, ...);`
  - `int fgetc(FILE *f);`
  - `char *fgets(char *s, int n, FILE *f);`
  - `int fputc(int c, FILE *f);`
  - `int fputs(const char *s, FILE *f);`
    - input/output functions from/to stream `f`
  - `int fflush(FILE *f);`
    - flushes any unwritten data from a buffer into the file

## Standard I/O Functions

- Functions declared in `stdio.h` (part 3/4)
  - `typedef unsigned int size_t;`
    - type for size of a block of memory (number of bytes)
  - `size_t fread(void *p, size_t s, size_t n, FILE *f);`
    - binary input to memory location `p` for `n` times `s` bytes from file `f`
  - `size_t fwrite(const void *p, size_t s, size_t n,
 FILE *f);`
    - binary output from memory location `p` for `n` times `s` bytes to file `f`
  - `long ftell(FILE *f);`
    - return the current position in file `f` (from beginning)
  - `int fseek(FILE *f, long pos, int w);`
    - move to position `pos` in file `f` (from beginning/current pos/end)
  - `void rewind(FILE *f);`
    - move to beginning of file `f`
  - `int feof(FILE *f);`
    - check if end of file `f` is reached

## Standard I/O Functions

- Functions declared in `stdio.h` (part 4/4)
  - `int perror(FILE *f);`
    - returns the current error status for file `f`
  - `void perror(const char *prg);`
    - print current error for program `prg` to stream `stderr`
  - `int remove(const char *filename);`
    - delete file `filename`
  - `int rename(const char *old, const char *new);`
    - rename file `old` to new name `new`

## File Processing

  - Digital image manipulation
    - Read an image from a file
    - Manipulate the image in memory
    - Write the modified image to file
  - Portable Pixel Map (PPM) file format
    - Simple uncompressed file format for color images
    - Header section (including picture width, height)

## Translation Units

- Introduction
  - C compilation process is a sequence of phases
    1. Preprocessing (handle # directives)
    2. Scanning and parsing (generate internal data structure)
    3. Instruction generation (emit stream of CPU instructions)
    4. Assembly (generate binary object file)
    5. Linking (combine objects into executable file)
  - C compiler consists of separate components
    - Preprocessor (processes # directives)
    - Compiler (compiles and assembles code)
    - Linker (processes object files and libraries)

## Translation Units

- Compilation Phases
  - Source code
    - Program files
    - Header files
  - Preprocessed file
  - Object files
  - Library files
  - Executable file

## Translation Units

- Source files
  - Header files: **Program.h**
    - Inclusion of required header files
    - Definitions of exported constants
    - Declarations of exported global variables
    - Declarations of exported functions
  - Program files: **Program.c**
    - Inclusion of required header files
    - Declaration and definition of local variables
    - Declaration and definition of local functions
    - Definitions of exported global variables
    - Definitions of exported functions

## Translation Units

- C Preprocessor
  - preprocesses source files
  - handles # directives
- Preprocessing Directives
  - Constant definition `#define WIDTH 540`
  - Macro definition `#define ABS(x) (x>0 ? x : -x)`
  - Header file inclusion `#include <stdio.h>`
  - Conditional compilation

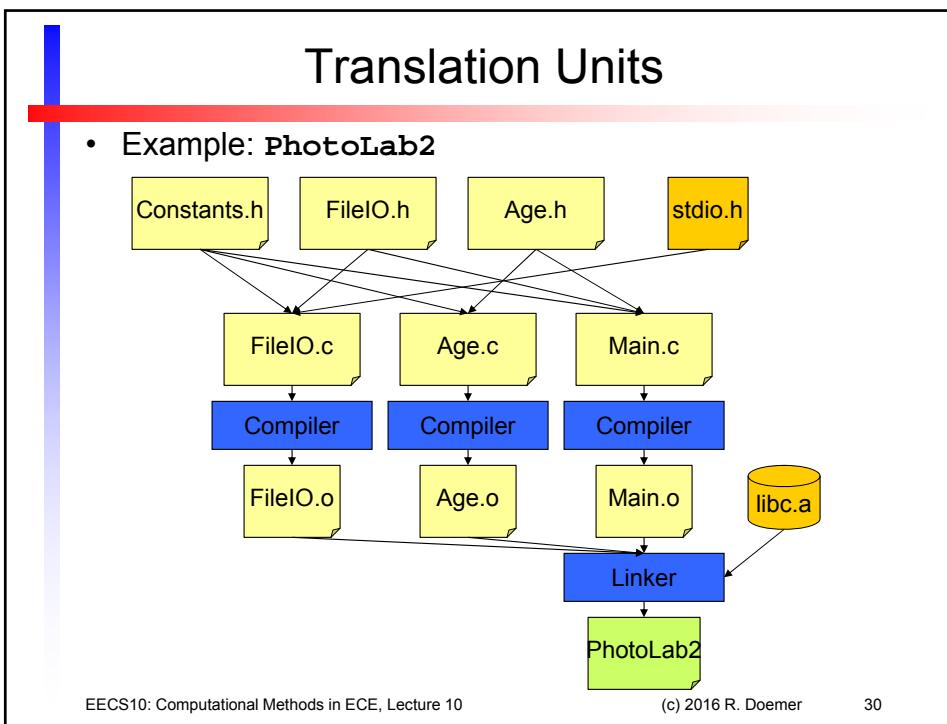

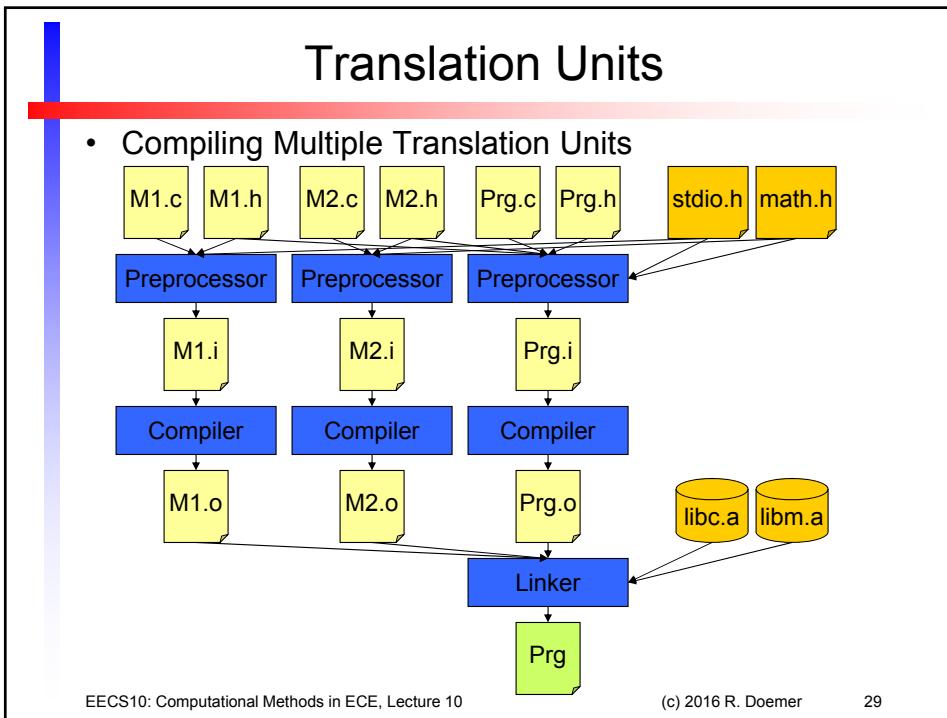

```
#define DEBUG /* comment out to turn debugging off */
...
#endif
#define DEBUG
printf("value of x is now %d\n", x);
#endif
```

## Translation Units

- Object files
  - **Program.o**
    - Compiled object code of source file **Program.c**
    - Use option **-c** in GNU compiler call to create object files  
`gcc -c Program.c -o Program.o -Wall -ansi`
  - **Library.a**
    - Archive of compiled object files
- Executable file
  - **Program**
    - Object files and libraries linked together into a complete file ready for execution
    - GNU compiler recognizes object files by .o suffix, so object files and libraries require no special option  
`gcc Program.o -lc -lm -o Program`

## Translation Units

- Multiple Translation Units
  - C programs can be partitioned into multiple translation units, aka. *modules*
  - Modules typically consist of
    - Module header file (file suffix .h)
    - Module program file (file suffix .c)
    - Module object file (file suffix .o)
  - Modules are *linked* together
    - Linker combines object files and required libraries into an executable file
    - `gcc Program.o Mod1.o Mod2.o -lc -lm -Wall -ansi -o Program`

## Translation Units

- Example: Header file **Constants.h**

```
*****  
/* Constants.h: header file for constant definitions */  
/* author: Rainer Doemer */  
/* modifications: (most recent first) */  
/* 08/18/16 RD version for Summer 2016 */  
*****  
  
#ifndef CONSTANTS_H  
#define CONSTANTS_H  
  
/** global definitions **/  
  
#define WIDTH 530      /* image width */  
#define HEIGHT 384     /* image height */  
#define SLEN    80      /* max. string length */  
  
#endif /* CONSTANTS_H */  
  
/* EOF Constants.h */
```

               unsigned char B[WIDTH][HEIGHT])
{ /* ... function body ... */}

/** function declarations **/  

void Age( /* age the image */
          unsigned char R[WIDTH][HEIGHT],
          unsigned char G[WIDTH][HEIGHT],
          unsigned char B[WIDTH][HEIGHT]);
