## Lecture 10.1: Overview

- File Processing
  - Introduction
  - Standard input and output streams
  - File streams, I/O
  - Standard library functions in `stdio.h`
  - Program example `PhotoLab.c`

## File Processing

- Introduction
  - Up to now, all data processed is available only during program run time
    - At program completion, all data is lost
  - *Persistent data* is stored even after a program exits
  - Persistent data is stored in files...
    - ... on the harddisk
    - ... on a removable disk (CD, memory stick, ...)
    - ... on a tape, ...
  - Input and output from/to files is organized as *I/O streams*

## File Processing

- I/O Streams
  - Standard I/O streams (opened by the system)
    - `stdin`      standard input stream (i.e. `scanf()`)
    - `stdout`     standard output stream (i.e. `printf()`)
    - `stderr`    standard error stream (i.e. `perror()`)
  - File I/O streams (explicitly opened by a program)
    - Open a file            `fopen()`
    - Write data to a file   `fprintf()`, `fputs()`, etc.
    - Read data from a file `fscanf()`, `fgets()`, etc.
    - Close a file            `fclose()`
  - In C, all I/O functions are ...
    - ... declared in header file `stdio.h`
    - ... implemented in the standard C library

## Standard I/O Functions

- Functions declared in `stdio.h` (part 2/4)
  - `typedef __FILE FILE;`
    - opaque type for a file handle
  - `FILE *fopen(const char *n, const char *m);`
    - open file named `n` for input ("`r`"), output ("`w`"), or append ("`a`")
    - returns a file handle, or `NULL` in case of an error
  - `int fclose(FILE *f);`
    - closes an open file handle
  - `int fprintf(FILE *f, const char *fmt, ...);`
  - `int fscanf(FILE *f, const char *fmt, ...);`

  - `int fflush(FILE *f);`
    - flushes any unwritten data from a buffer into the file

## Standard I/O Functions

- Functions declared in `stdio.h` (part 3/4)
  - `typedef unsigned int size_t;`
    - type for size of a block of memory (number of bytes)
  - `size_t fread(void *p, size_t s, size_t n, FILE *f);`
    - binary input to memory location `p` for `n` times `s` bytes from file `f`
  - `size_t fwrite(const void *p, size_t s, size_t n, FILE *f);`
    - binary output from memory location `p` for `n` times `s` bytes to file `f`
  - `long ftell(FILE *f);`
    - return the current position in file `f` (from beginning)
  - `int fseek(FILE *f, long pos, int w);`
    - move to position `pos` in file `f` (from beginning/current pos/end)
  - `void rewind(FILE *f);`
    - move to beginning of file `f`
  - `int feof(FILE *f);`
    - check if end of file `f` is reached

## Standard Library Functions

- Functions declared in `stdio.h` (part 4/4)
  - `int ferror(FILE *f);`
    - returns the current error status for file `f`
  - `void perror(const char *prg);`
    - print current error for program `prg` to stream `stderr`
  - `int remove(const char *filename);`
    - delete file `filename`
  - `int rename(const char *old, const char *new);`
    - rename file `old` to new name `new`

## File Processing
