

EECS 22: Advanced C Programming

Lecture 4 (TuTh)

Rainer Dömer

doemer@uci.edu

The Henry Samueli School of Engineering
Electrical Engineering and Computer Science
University of California, Irvine

Part 1: Overview

- Review of the C Programming Language
 - Introduction to Data Structures
 - Arrays
 - Introduction
 - Indexing
 - Initialization
 - Multi-Dimensional Arrays
 - Program Example `Histogram.c`

Review of the C Programming Language

- Introduction to Data Structures
 - Until now, we have used only single data elements of basic (non-composite) type
 - integral types
 - floating point types
 - Most programs, however, require complex *data structures* using composite types
 - arrays, lists, queues, stacks
 - trees, graphs
 - dictionaries
 - ANSI C provides built-in support for
 - arrays
 - structures, unions, enumerators
 - pointers

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

3

Arrays

- Array data type in C
 - Composite data type
 - Type is an array of a sub-type (e.g. array of `int`)
 - Fixed number of elements
 - Array size is fixed at time of definition (e.g. 100 elements)
 - Element access by index (aka. subscript)
 - Element-access operator: `array[index]` (e.g. `A[42]`)
- Example:

```
int A[10]; /* array of ten integers */  
  
A[0] = 42; /* access to elements */  
A[1] = 100;  
A[2] = A[0] + 5 * A[1];
```

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

4

Arrays

- Array Indexing
 - Start counting from 0
 - First element has index 0
 - Last element has index *Size-1*

- Example:

```
int A[10];

A[0] = 42;
A[1] = 100;
A[2] = A[0] + 5 * A[1];
A[3] = -1;
A[4] = 44;
A[5] = 55;
/* ... */
A[9] = 99;
```

	A
0	42
1	100
2	542
3	-1
4	44
5	55
6	0
7	0
8	0
9	99

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

5

Arrays

- Array Indexing
 - for loops are often very helpful
 - `for(i=0; i<N; i++)`
`{...A[i]...}`

- Example:

```
int A[10];
int i;

for(i=0; i<10; i++)
{ A[i] = i*10 + i;
}
for(i=0; i<10; i++)
{ printf("%d, ", A[i]);
}
```

	A
0	0
1	11
2	22
3	33
4	44
5	55
6	66
7	77
8	88
9	99

```
0, 11, 22, 33, 44, 55, 66, 77, 88, 99,
```

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

6

Arrays

- Array Indexing
 - Array indices are *not* checked by the compiler, nor at runtime!
 - Accessing an array with an *index out of range* results in undefined behavior!
- Example:

```
int A[10];
int i;

A[-1] = 42; /* INVALID ACCESS! */

for(i=0; i<=10; i++)
  /* INVALID LOOP RANGE! */
  { printf("%d, ", A[i]);
    }
}
```

0	0
1	0
2	0
3	0
4	0
5	0
6	0
7	0
8	0
9	0

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

7

Arrays

- Array Initialization
 - Static initialization at time of array definition
 - Initial elements listed in { }
- Example:

```
int A[10] = { 42, 100,
             310, 44,
             55, 0,
             3, 4,
             0, 99};
```

	A
0	42
1	100
2	310
3	44
4	55
5	0
6	3
7	4
8	0
9	99

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

8

Arrays

- Array Initialization
 - Static initialization at time of array definition
 - Initial elements listed in { }

- Example:

```
int A[ ] = { 42, 100,
            310, 44,
            55, 0,
            3, 4,
            0, 99};
```

- With given initializer list, array size may be omitted
 - automatically determined

	A
0	42
1	100
2	310
3	44
4	55
5	0
6	3
7	4
8	0
9	99

Arrays

- Array Initialization
 - Static initialization at time of array definition
 - Initial elements listed in { }

- Example:

```
int A[10] = { 1, 2, 3};
```

- With given initializer list *and* array size, unlisted elements are zero-initialized
 - array is filled up with zeros

	A
0	1
1	2
2	3
3	0
4	0
5	0
6	0
7	0
8	0
9	0

Arrays

- Array Initialization
 - C99 standard introduces *Designated Initializers*
 - Designated elements listed in { }

- Example:

```
int A[10] = { A[2]=2,
             A[4]=4,
             A[8]=8 };
```

- Designated elements are initialized as specified
- Unspecified elements are zero-initialized

	A
0	0
1	0
2	2
3	0
4	4
5	0
6	0
7	0
8	8
9	0

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

11

Multi-Dimensional Arrays

- Multi-dimensional arrays are modeled as *Arrays of arrays (of arrays...)*
- Example:

```
int M[3][2] = {{1, 2},
               {3, 4},
               {5, 6}};

int i, j;

for(i=0; i<3; i++)
  { for(j=0; j<2; j++)
    { printf("%d ",
            M[i][j]);
      }
    printf("\n");
  }
```

M	0	1
0	1	2
1	3	4
2	5	6

```
1 2
3 4
5 6
```

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

12

Multi-Dimensional Arrays

- Storage Allocation for Multi-Dimensional Arrays
 - Example: `Array[Dim1][Dim2]...[DimN]`
 - Need space for $Dim1 * Dim2 * \dots * DimN$ elements
 - `sizeof(int[5][100]) = sizeof(int)*5*100`
- Storage in Linear Address Space in Memory
 - In storage order, right-most index varies the fastest
 - To obtain the linear offset of a given array element, left indices need to be multiplied by the sizes on the right
 - `int A[10];` `A[5]` is the 5th element (starting with 0th element)
 - `int M[6][7];` `M[3][2]` is the $3*7+2 = 23^{\text{rd}}$ element
 - `int T[2][8][5];` `T[1][2][3]` is the $1*8*5+2*5+3 = 53^{\text{rd}}$ element
 - When declaring arrays as parameters for functions, the left-most size is irrelevant and can be omitted
 - `int f(int M[][7]);`

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

13

Multi-Dimensional Arrays

- Example: Allocation of 2-dimensional Arrays: Tables
 - Rows (major)
 - Columns (minor)

```
#define ROWS 3
#define COLS 2
int M[ROWS][COLS]
= {{1, 2},
   {3, 4},
   {5, 6}};
```

M	0	1
0	1	2
1	3	4
2	5	6

- Linear memory layout:

```
int M[ROWS][COLS] = {{1, 2}, {3, 4}, {5, 6}};
```

```
M[0][0] M[0][1] M[1][0] M[1][1] M[2][0] M[2][1]
```

1	2	3	4	5	6
---	---	---	---	---	---

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

14

Program Example

- **Histogram.c**
 - Display a simple bar chart for 10 integer values
- Desired output:

```
% ./Histogram
Please enter data value 1: 111
Please enter data value 2: 222
Please enter data value 3: 33
Please enter data value 4: 333
[...]
Please enter data value 10: 111
1: 111 *****
2: 222 *****
3: 33 ****
4: 333 *****
[...]
10: 111 *****
%
```

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

15

Program Example

- **Histogram.c (part 1/3)**

```
/* Histogram.c: print a histogram of data values */
/* author: Rainer Doemer */
/* modifications: */
/* 11/02/04 RD initial version */

#include <stdio.h>

/* constants */
#define NUM_ROWS 10

/* main function */
int main(void)
{
    /* variable definitions */
    int Data[NUM_ROWS];
    int i, j, max;
    double scale;

    ...
}
```

EECS22: Advanced C Programming, Lecture 5

(c) 2017 R. Doemer

16

Program Example

- **Histogram.c** (part 2/3)

```

...
/* input section */
for(i = 0; i < NUM_ROWS; i++)
{ printf("Please enter data value %2d: ", i+1);
  scanf("%d", &Data[i]);
} /* rof */

/* computation section */
max = 0;
for(i = 0; i < NUM_ROWS; i++)
{ if (Data[i] > max)
  { max = Data[i];
    } /* fi */
} /* rof */
scale = 70.0 / max;
...

```

Program Example

- **Histogram.c** (part 3/3)

```

...
/* output section */
for(i = 0; i < NUM_ROWS; i++)
{ printf("%2d: %5d ", i+1, Data[i]);
  for(j = 0; j < Data[i]*scale; j++)
  { printf("");
    } /* rof */
  printf("\n");
} /* rof */

/* exit */
return 0;
} /* end of main */

/* EOF */

```

Program Example

- Example session: `Histogram.c`

```
% vi Histogram.c
% gcc Histogram.c -o Histogram -Wall -ansi -std=c99
% ./Histogram
Please enter data value 1: 11
Please enter data value 2: 22
Please enter data value 3: 3
Please enter data value 4: 33
Please enter data value 5: 44
Please enter data value 6: 55
Please enter data value 7: 66
Please enter data value 8: 33
Please enter data value 9: 22
Please enter data value 10: 22
1: 11 *****
2: 22 *****
3: 3 ****
4: 33 *****
5: 44 *****
6: 55 *****
7: 66 *****
8: 33 *****
9: 22 *****
10: 22 *****
%
```

Variable-Length Arrays (C99)

- Arrays have a fixed number of elements
 - Size is allocated at time of variable definition
 - Size cannot change after allocation
- C/C++ standard has evolved over time
 - Traditional C: array size is a compile-time constant
 - C99: *variable-length array* size is determined at run-time
 - C11: variable-length array support is optional (*not* guaranteed)
 - C++: variable-length arrays are *not* supported
- Example revised for C99 standard:
 - Allow the user to input the number of data values desired
 - Allocate the Data array with size defined by variable value

Program Example (C99)

- Histogram2.c (part 1/3)

```

/* Histogram2.c: print a histogram of data values */
/* author: Rainer Doemer */
/* modifications: */
/* 09/18/17 RD version with variable-length array */
/* 11/02/04 RD initial version */

#include <stdio.h>

/* main function */
int main(void)
{ /* input section */
  int NumRows;
  printf("Number of data values: ");
  scanf("%d", &NumRows);

  /* variable definitions */
  int Data[NumRows]; // variable-length array (C99)
  int i, j, max;
  double scale;
  ...

```

Program Example (C99)

- Histogram2.c (part 2/3)

```

...
/* input section */
for(i = 0; i < NumRows; i++)
{ printf("Please enter data value %2d: ", i+1);
  scanf("%d", &Data[i]);
} /* rof */

/* computation section */
max = 0;
for(i = 0; i < NumRows; i++)
{ if (Data[i] > max)
  { max = Data[i];
    } /* fi */
} /* rof */
scale = 70.0 / max;
...

```

Program Example (C99)

- Histogram2.c (part 3/3)

```

...
/* output section */
for(i = 0; i < NumRows; i++)
{ printf("%2d: %5d ", i+1, Data[i]);
  for(j = 0; j < Data[i]*scale; j++)
  { printf("*");
    } /* rof */
  printf("\n");
} /* rof */

/* exit */
return 0;
} /* end of main */

/* EOF */

```

Program Example (C99)

- Example session: Histogram2.c

```

% vi Histogram2.c
% gcc Histogram2.c -o Histogram2 -Wall -ansi -std=c99
% ./Histogram2
Number of data values: 8
Please enter data value 1: 11
Please enter data value 2: 22
Please enter data value 3: 3
Please enter data value 4: 33
Please enter data value 5: 44
Please enter data value 6: 55
Please enter data value 7: 66
Please enter data value 8: 33
1: 11 *****
2: 22 *****

4: 33 *****
5: 44 *****
6: 55 *****
7: 66 *****
8: 33 *****
%

```

Part 2: Overview

- Review of the C Programming Language
 - Types
 - Basic types and typical ranges
 - Type conversion
 - Types in expressions
 - Type qualifiers
 - Application Example `PhotoLab.c`

EECS22: Advanced C Programming, Lecture 6

(c) 2017 R. Doemer

25

Basic Types, Ranges

- Integer Types
 - `char` Character, e.g. `'a'`, `'b'`, `'1'`, `'*'`
 - typical range **8 bit** [-128,127]
 - `short int` Short integer, e.g. -7, 0, 42
 - typical range **16 bit** [-32768,32767]
 - `int` Integer, e.g. -7, 0, 42
 - typical range **32 bit** [-2147483648,2147483647]
 - `long int` Long integer, e.g. -99L, 9L, 123L
 - typical range **64 bit** (same as long long int)
 - `long long int` Very long integer, e.g. 12345LL
 - typical range **64 bit**
[-9223372036854775808,9223372036854775807]
- Integer Types can be
 - `signed` negative and positive values (incl. 0)
 - `unsigned` positive values only (incl. 0)

EECS22: Advanced C Programming, Lecture 6

(c) 2017 R. Doemer

26

Basic Types, Ranges

- Floating Point Types
 - **float** Floating point with single precision
 - Typical representation: $24 + 8 = 32$ bit
 - Example: `3.5f`, `-0.234f`, `10e8f`
 - **double** Floating point with double precision
 - Typical representation: $53 + 11 = 64$ bit
 - Example: `3.5`, `-0.23456789012`, `10e88`
 - **long double** Floating point with high precision
 - Typical representation: $113 + 15 = 128$ bit
 - Example: `12345678.123456e123L`
- Remember:
 - Most floating point values are *approximations only!*
 - Finite storage size can only store finite amount of numbers

Type Conversion

- Explicit Type Conversion
 - types can be explicitly converted to other types, by use of the type cast operator:
 - **(type) expression**
 - the target type is named explicitly in parentheses before the source expression
 - Examples:
 - **Float = (float) LongInt**
 - converts the `long int` value into a `float` value
 - **Integer = (int) Double**
 - converts the `double` value into an `int` value
 - any fractional part is truncated!
 - **Char = (char) LongLongInt**
 - converts the `long long int` value into a `char` value
 - any out-of-range values are silently cut off!

Type Conversion

- Implicit Type Conversion
 - Type promotion
 - integral promotion
 - `unsigned` or `signed char` is promoted to `unsigned` or `signed int` before any operation
 - `unsigned` or `signed short` is promoted to `unsigned` or `signed int` before any operation
 - binary arithmetic operators are defined only for same types
 - the smaller type is converted to the larger type (before operation)
 - Examples:
 - » `ShortInt * LongInt` results in a `long int` type
 - » `LongDouble * Float` results in a `long double` type
 - Type coercion
 - most types are automatically converted to expected types
 - Example: `Double = Float`, or `Char = LongInt`

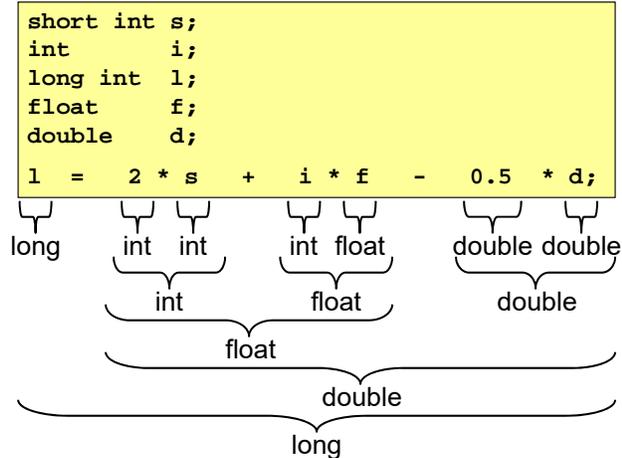

EECS22: Advanced C Programming, Lecture 6

(c) 2017 R. Doemer

29

Types in Expressions

- Expressions are composed of constants, variables and operators, each of which has an associated type
- Example:

EECS22: Advanced C Programming, Lecture 6

(c) 2017 R. Doemer

30

Type Qualifiers

- Types may be further qualified
 - Type qualifier **const**
 - The value of a **const** object cannot be changed
 - Initialization is mandatory, assignment is not possible
 - Example:
 - `const double pi = 3.1415926536;`
 - Object may be placed in read-only memory (ROM)
 - Type qualifier **volatile**
 - The value of a **volatile** object must not be used for compiler optimizations
 - Machine registers for memory-mapped I/O are volatile
 - Example:
 - `volatile char *StatusReg = 0x40000000;`
 - `while(*StatusReg == 0x00) ;`
 - Accesses to **volatile** objects must not be optimized away

EECS22: Advanced C Programming, Lecture 6

(c) 2017 R. Doemer

31

Application Example

- Program example: **PhotoLab**
 - Digital image manipulation
 - Read an image from a file
 - Manipulate the image in memory
 - Write the modified image to file
 - Portable Pixel Map (PPM) file format
 - simple uncompressed file format for color images
 - Header section (including picture width, height)
 - Data section (pixel values in Red/Green/Blue format)

```
P6
600 400
255
RGBRGBRGB...
```

EECS22: Advanced C Programming, Lecture 6

(c) 2017 R. Doemer

32

Application Example

- Program example: PhotoLab.c (part 1/5)

```

/*****
/* PhotoLab.c: assignment 2 for EECS 22 in Fall 2017   */
/*
/* modifications: (most recent first)                */
/* 09/27/17 RD   adjusted for lecture usage          */
/*****

#include <stdio.h>
#include <stdlib.h>

/** global definitions **/

const int WIDTH = 600;    /* image width */
const int HEIGHT = 400;   /* image height */
const int SLEN = 80;      /* max. string length */

...

```

Application Example

- Program example: PhotoLab.c (part 2/5)

```

...
/** function definitions **/

/* write the RGB image to a PPM file   */
/* (return 0 for success, >0 for error) */

int SaveImage(const char Filename[SLEN],
              unsigned char R[WIDTH][HEIGHT],
              unsigned char G[WIDTH][HEIGHT],
              unsigned char B[WIDTH][HEIGHT])
{
    ...
} /* end of SaveImage */

...

```

Application Example

- Program example: PhotoLab.c (part 3/5)

```

...
/* read an image file into the RGB data structure */
/* (return 0 for success, >0 for error) */

int LoadImage(const char fname[SLEN],
              unsigned char R[WIDTH][HEIGHT],
              unsigned char G[WIDTH][HEIGHT],
              unsigned char B[WIDTH][HEIGHT])
{
    ...
} /* end of LoadImage */
...

```

Application Example

- Program example: PhotoLab.c (part 4/5)

```

...
/* modify the image... ;- ) */

void ModifyImage(unsigned char R[WIDTH][HEIGHT],
                unsigned char G[WIDTH][HEIGHT],
                unsigned char B[WIDTH][HEIGHT])
{
    int x, y;

    for(y=0; y<HEIGHT; y++)
    {
        for(x=0; x<WIDTH; x++)
        {
            B[x][y] = (R[x][y] + G[x][y] + B[x][y]) / 5;
            R[x][y] = (unsigned char) (B[x][y]*1.6);
            G[x][y] = (unsigned char) (B[x][y]*1.6);
        }
    }
} /* end of ModifyImage */
...

```

Application Example

- Program example: PhotoLab.c (part 5/5)

```

...
/** main program */

int main(void)
{
    unsigned char R[WIDTH][HEIGHT];
    unsigned char G[WIDTH][HEIGHT];
    unsigned char B[WIDTH][HEIGHT];

    if (LoadImage("HSSOE.ppm", R,G,B) != 0)
        { return 10; }
    ModifyImage(R, G, B);
    if (SaveImage("HSSOE1965.ppm", R,G,B) != 0)
        { return 10; }
    return 0;
} /* end of main */

/* EOF */

```

EECS22: Advanced C Programming, Lecture 6

(c) 2017 R. Doemer

37

Application Example

- Example session: PhotoLab.c

```

% vi PhotoLab.c
% gcc PhotoLab.c -o PhotoLab -Wall -ansi -std=c99
% pnmtjpeg HSSOE.ppm > HSSOE.jpg
% PhotoLab
% pnmtjpeg HSSOE1965.ppm > HSSOE1965.jpg
%

```

HSSOE.ppm

HSSOE1965.ppm

EECS22: Advanced C Programming, Lecture 6

(c) 2017 R. Doemer

38
