Chapter 3

Introduction to Classes, Objects and Strings

C++ How to Program, 8/e

©1992–2012 by Pearson Education, Inc. All Rights Reserved.

3.2 Defining a Class with a Member Function

- ▶ We begin with an example (Fig. 3.1) that consists of class `GradeBook` (lines 8–16), which, when it is fully developed in Chapter 7, will represent a grade book that an instructor can use to maintain student test scores, and a `main` function (lines 19–23) that creates a `GradeBook` object.
- ▶ Function `main` uses this object and its member function to display a message on the screen welcoming the instructor to the grade-book program.

```
1 // Fig. 3.1: fig03_01.cpp
2 // Define class GradeBook with a member function displayMessage,
3 // create a GradeBook object, and call its displayMessage function.
4 #include <iostream>
5 using namespace std;
6
7 // GradeBook class definition
8 class GradeBook
9 {
10 public:
11 // function that displays a welcome message to the GradeBook user
12 void displayMessage()
13 {
14     cout << "Welcome to the Grade Book!" << endl;
15 } // end function displayMessage
16 }; // end class GradeBook
17
```

Fig. 3.1 | Define class GradeBook with a member function displayMessage, create a GradeBook object and call its displayMessage function. (Part 1 of 2.)

```
18 // function main begins program execution
19 int main()
20 {
21     GradeBook myGradeBook; // create a GradeBook object named myGradeBook
22     myGradeBook.displayMessage(); // call object's displayMessage function
23 } // end main
```

Welcome to the Grade Book!

Fig. 3.1 | Define class GradeBook with a member function displayMessage, create a GradeBook object and call its displayMessage function. (Part 2 of 2.)

3.3 Defining a Member Function with a Parameter (cont.)

- ▶ Fig. 3.3 redefines class `GradeBook` (lines 9–18) with a `displayMessage` member function (lines 13–17) that displays the course name as part of the welcome message.
 - The new version of `displayMessage` requires a parameter (`courseName` in line 13) that represents the course name to output.
- ▶ A variable of type `string` represents a string of characters.
- ▶ A string is actually an object of the C++ Standard Library class `string`.
 - Defined in header `<string>` and part of namespace `std`.
 - For now, you can think of `string` variables like variables of other types such as `int`.
 - Additional `string` capabilities in Section 3.9.

3 // create a GradeBook object and call its displayMessage function.
4 #include <iostream>
5 #include <string> // program uses C++ standard string class
6 using namespace std;
7
8 // GradeBook class definition
9 class GradeBook
10 {
11 public:
12     // function that displays a welcome message to the GradeBook user
13     void displayMessage( string courseName )
14     {
15         cout << "Welcome to the grade book for\n" << courseName << "! "
16             << endl;
17     } // end function displayMessage
18 }; // end class GradeBook
19

```

3.4 Data Members, set Functions and get Functions (cont.)

- ▶ An object has attributes that are carried with it as it's used in a program.
 - Such attributes exist throughout the life of the object.
 - A class normally consists of one or more member functions that manipulate the attributes that belong to a particular object of the class.
- ▶ Attributes are represented as variables in a class definition.
 - Such variables are called **data members** and are declared inside a class definition but outside the bodies of the class's member-function definitions.
- ▶ Each object of a class maintains its own copy of its attributes in memory.

©1992–2012 by Pearson Education, Inc.
All Rights Reserved.

3.4 Data Members, set Functions and get Functions (cont.)

- ▶ A typical instructor teaches multiple courses, each with its own course name.
- ▶ A variable that is declared in the class definition but outside the bodies of the class's member-function definitions is a data member.
- ▶ Every instance (i.e., object) of a class contains one copy of each of the class's data members.
- ▶ A benefit of making a variable a data member is that all the member functions of the class can manipulate any data members that appear in the class definition.

3.5 Initializing Objects with Constructors

- ▶ Each class can provide a **constructor** that can be used to initialize an object of the class when the object is created.
- ▶ A constructor is a special member function that must be defined with the same name as the class, so that the compiler can distinguish it from the class's other member functions.
- ▶ An important difference between constructors and other functions is that constructors cannot return values, so they cannot specify a return type (not even **void**).
- ▶ Normally, constructors are declared **public**.

©1992–2012 by Pearson Education, Inc.
All Rights Reserved.

3.5 Initializing Objects with Constructors (cont.)

- ▶ C++ requires a constructor call for each object that is created, which helps ensure that each object is initialized before it's used in a program.
- ▶ The constructor call occurs implicitly when the object is created.
- ▶ If a class does not explicitly include a constructor, the compiler provides a **default constructor**—that is, a constructor with no parameters.

3.6 Placing a Class in a Separate File for Reusability (cont.)

- ▶ Each of the previous examples in the chapter consists of a single `.cpp` file, also known as a **source-code file**, that contains a `GradeBook` class definition and a `main` function.
- ▶ When building an object-oriented C++ program, it's customary to define reusable source code (such as a class) in a file that by convention has a `.h` filename extension—known as a **header**.
- ▶ Programs use `#include` preprocessor directives to include headers and take advantage of reusable software components.

3.7 Separating Interface from Implementation

- ▶ **Interfaces** define and standardize the ways in which things such as people and systems interact with one another.
- ▶ The **interface of a class** describes what services a class's clients can use and how to request those services, but not how the class carries out the services.
- ▶ A class's **public** interface consists of the class's **public** member functions (also known as the class's **public services**).

```

1 // Fig. 3.11: GradeBook.h
2 // GradeBook class definition. This file presents GradeBook's public
3 // interface without revealing the implementations of GradeBook's member
4 // functions, which are defined in GradeBook.cpp.
5 #include <string> // class GradeBook uses C++ standard string class
6 using namespace std;
7
8 // GradeBook class definition
9 class GradeBook
10 {
11 public:
12     GradeBook( string ); // constructor that initializes courseName
13     void setCourseName( string ); // function that sets the course name
14     string getCourseName(); // function that gets the course name
15     void displayMessage(); // function that displays a welcome message
16 private:
17     string courseName; // course name for this GradeBook
18 }; // end class GradeBook

```

3.7 Separating Interface from Implementation (cont.)

- ▶ Source-code file `GradeBook.cpp` (Fig. 3.12) defines class `GradeBook`'s member functions, which were declared in lines 12–15 of Fig. 3.11.
- ▶ Notice that each member-function name in the function headers (lines 9, 15, 21 and 27) is preceded by the class name and `::`, which is known as the **binary scope resolution operator**.
- ▶ This “ties” each member function to the (now separate) `GradeBook` class definition (Fig. 3.11), which declares the class's member functions and data members.

3.8 Validating Data with *set Functions*

- ▶ The program of Figs. 3.15–3.17 enhances class `GradeBook`'s member function `setCourseName` to perform **validation** (also known as **validity checking**).
- ▶ Since the interface of the class remains unchanged, clients of this class need not be changed when the definition of member function `setCourseName` is modified.
- ▶ This enables clients to take advantage of the improved `GradeBook` class simply by linking the client code to the updated `GradeBook`'s object code.
